is, in spite of a temporary lull in the activity of our sculptors—although here also there are bright exceptions—an exhibition of great interest. I do not know how far it will be thought that any one work compels the attention as a work of paramount merit among all the others; but I do know that, if it became me to do so, I could single out works, more than a few, which fill me with wondering admiration. This, meanwhile, is certain—it is an exhibition in which the level of achievement reached is a high one, and embraces effects of the most varied character. In figure painting it includes designs of a purely imaginative type, though of these I should gladly have welcomed more—works of a narrative and dramatic tendency, domestic and idyllic scenes, and, last but not least, portraiture exceptionally powerful and fine. Landscape asserts itself after the heart of Englishmen, and this, too, in much variety, not only in homely transcripts of intimate rustic scenes, of fragrant meadows, or of sunlit downs, but also of renderings of nature in her graver forms and aspects—the sounding coast, the land labour of the sea, and the silence of mist-shrouded hills. The well-filled—I fear over-filled—gallery devoted to water-colour testifies to the vigour and exuberant productions in that branch of art, and the pretty room beyond displays, for the first time in an unbroken front, the etcher's fascinating craft. The note which seems to me to predominate in our show is variety—variety in aims and variety in expressions. May this attribute long distinguish the exhibitions of our Academy, of which comprehensiveness is the strength, and catholicity should for ever be the corner-stone!

### ANCIENT REMAINS IN SULINA.

THE English Vice-Consul gives the following account of remains in his district:—

*Adam-Klissi.*—This is a massive stone structure erected in a solitary spot twelve miles to the south-east of Rasso, on the Danube, and twenty-five miles to the south of Megidie. It is about 36 feet high and 48 feet in diameter. The outer casing of this monument is circular, and is formed of small stones bound together by a cement that has withstood the elements for many a century. A large gap in the eastern partition of this casing reveals an inner wall formed of fine blocks, well fitted together, but not cemented. At the foot of this ancient tower a circular depression in the ground is distinctly visible, showing traces of a former ditch that no doubt protected this stronghold. Hidden from view by a thick brushwood are several large loose blocks of stone, the sculptures on which, though somewhat defaced, are of great interest. They depict trophies of barbarian warriors, chariots, military scenes, and also architectural ornaments like palm-leaves, &c. The date of the construction of this pile is fixed, by Roumanian antiquaries, as far back as the fourth century, and it is of Roman origin. Over fifty new bas-reliefs and several statues have been excavated in recent years. They all represent warlike scenes between Roman soldiers and long-bearded barbarians. In the vicinity of the Adam-Klissi monument there are the remains of a large Roman camp, with its towers and rampart. The principal *enceinte* of the camp measures about 550 yards by 330. The arched entrance gate is still standing, as well as the collection of outer works. The whole forms an imposing mass of ruins.

*Tomis.*—For a long time the site of ancient Tomis was disputed, but it now seems decided that Kiustenge is situated on the site of the old commercial town, or, at any rate, very near it. A great many ancient remains have been found near Kiustenge, and every excavation that takes place brings to light ancient relics and coins, principally belonging to that period of the Roman Empire which is comprised between the reigns of Augustus and Philip. To judge from these coins, Jupiter and Bacchus appear to have been the objects of deep veneration on the part of the inhabitants of Tomis. In several parts of the modern town the remains of foundations of ancient monuments and edifices are visible, and it is reported that during the building of the railway near Kiustenge several statues and stones with inscriptions were dug up and shipped to London.

*Callatia.*—Though there have not been extensive excavations near the modern town of Mangalia, the few inscriptions and coins already discovered on the spot render it probable that Mangalia now occupies the site of ancient Callatia. Some of the coins found near the town depict the head of Hercules with the name of the town, and barbarian war implements on the reverse. A sample of this coin is to be seen at the British Museum. The remainder of the coins represent other Roman emperors. Hercules, the patron of Heraclea, appears, from the coins, to have been the divinity specially honoured at Callatia.

*Istrus.*—No modern town exists on the site of ancient Istrus, a site which has not yet been determined by competent authorities. It is supposed to have been situated on the coast, some twenty or thirty miles south of Tomis, and not far from

a village called Kara-Arman. A certain number of coins, with the inscription of the old town, have already been discovered.

*Troesmis.*—This was one of the numerous Roman military stations. The modern village of Iglitza, about eight miles from Macin, lies near the ruin, situated principally on the adjoining rocky heights. Several interesting inscriptions have been excavated and carried off, principally by French collectors.

*Trajan's Wall.*—This rampart—which completed the line of Roman defences established the whole length of the Danube, forming the frontier of Dacia—commenced between Cernavoda and Hirsova, on the Danube, and terminated at Kiustenge, on the Black Sea. Traces of the wall are still to be partially seen along the line of railway running parallel to it at several points.

*The Temple of Achilles.*—This temple, the few remains of which are to be found on Serpents Island, was noticed by Strabo, who mentions it as having been a magnificent edifice dedicated to the hero of the Trojan war, and looked upon with veneration by the Greeks as the resting-place of the soldiers of Ajax, Achilles, &c. Under the Russian domination many objects of antiquity were transported to Russia. In 1873 a private excavator found two marble slabs which, it is surmised, have been portions of the cornices of the temple, and also some Greek, Roman, Venetian, and Genoese coins. One of these slabs has been recently withdrawn from the island for conveyance to the museum at Bucharest. It is supposed that the ruins of the temple have not been wholly disinterred, and the Roumanian Government intend prosecuting a thorough search.

In addition to the foregoing important historical remains, the ruins of Roman camps and stations are to be seen in several places. There are also several "tumuli" all over the Dobrogea, but they have not as yet been systematically examined to show whether they conceal relics of the past or whether they are merely landmarks.

## TESSERÆ.

### The Influence of Decoration.

GEORGE ELIOT.

HAS anyone yet said what great things are being done by the men who are trying to banish ugliness from our streets and our homes, and to make both the outside and inside of our dwellings worthy of a world where there are forests and flower-tressed meadows and the plumage of birds, where the insects carry lessons of colour on their wings, and even the surface of a stagnant pool will show us the wonders of iridescence and the most delicate forms of leafage? They, too, are modifying opinions, for they are modifying men's moods and habits, which are the mothers of opinions, having quite as much to do with their formation as the responsible father—Reason. Think of certain hideous manufacturing towns where the piety is chiefly a belief in copious perdition, and the pleasure is chiefly gin. The dingy surface of wall pierced by the ugliest windows, the staring shopfronts, paper-hangings, carpets, brass and gilt mouldings, and advertising placards, have an effect akin to that of malaria; it is easy to understand that with such surroundings there is more belief in cruelty than in beneficence, and that the best earthly bliss attainable is the dulling of the external senses. For it is a fatal mistake to suppose that ugliness which is taken for beauty will answer all the purposes of beauty; the subtle relation between all kinds of truth and fitness in our life forbids that bad taste should ever be harmless to our moral sensibility or our intellectual discernment; and—more than that—as it is probable that fine musical harmonies have a sanative influence over our bodily organisation, it is also probable that just colouring and lovely combinations of lines may be necessary to the complete well-being of our systems apart from any conscious delight in them. A savage may indulge in discordant chuckles and shrieks and gutturals, and think that they please the gods, but it does not follow that his frame would not be favourably wrought upon by the vibrations of a grand church organ. One sees a person capable of choosing the worst style of wall-paper become suddenly afflicted by its ugliness under an attack of illness. And if an evil state of blood and lymph usually goes along with an evil state of mind, who shall say that the ugliness of our streets, the falsity of our ornamentation, the vulgarity of our upholstery, have not something to do with those bad tempers which breed false conclusions?

### The Temples at Pæstum.

E. A. FREEMAN.

Few buildings are more familiar than the temples of Pæstum, yet the moment when the traveller first comes in sight of works of untouched Hellenic skill is one which is simply overwhelming. Suddenly, by the side of a dreary road, in a spot backed, indeed, by noble mountains, but having no charm of its own, we come on these works, unrivalled on our side of the Adriatic and the Messinian Strait, standing in all their solitary grandeur,

shattered indeed, but far more perfect than the mass of ruined buildings of later days. The feeling of being brought near to Hellenic days and Hellenic men, of standing face to face with the fathers of the world's civilisation, is one which can never pass away. Descriptions, pictures, models, all fail; they give us the outward form, they cannot give us the true life. The thought comes upon us that we have passed away from that Roman world, out of which our own world has sprung, into that earlier, and fresher, and brighter world by which Rome and ourselves have been so deeply influenced, but out of which neither the Roman nor the modern world can be said to sprung. There is the true Doric in its earliest form, in all its unmixed and simple majesty. The ground is strewn with shells and covered with acanthus leaves, but no shell had suggested the Ionic volute, no acanthus leaf had suggested the Corinthian foliage. The vast columns with the sudden tapering, the overhanging capitals, the stern square abacus, all betoken the infancy of art. But it is an infancy like that of their own Hēraklēs, the strength which clutched the serpent in his cradle is there in every stone. Later improvements, the improvements in Attic skill, may have added grace; the perfection of art may be found in the city which the vote of the divine assembly decreed to Athene; but for the sense of power, of simplicity without rudeness, the city of Poseidon holds her own.

### Loads on Stone.

A. ASHPITEL.

It was observed by M. Rondelet in the course of his very numerous experiments that it was not the heaviest stones which offered the greatest degree of resistance to compression, but those of a fine even grain and close texture with a deep colour; that of granites, the most compact and perfectly crystallised was the strongest, and that when all other qualities were the same the strength was in proportion to some function of the specific gravity. The pillars of the Gothic church of All Saints at Angers, of Fourneaux stone, support on each superficial foot a pressure of 86,000 lbs. The pillars of the dome of the Panthéon at Paris, the lower part of which are of Bagneux stone, support on each superficial foot 60,000 lbs. The pillar in the centre of the chapter-house at Elgin, which is of red sandstone, supports on each superficial foot 40,000 lbs. The piers which support the dome of St. Paul's in London sustain a pressure on each superficial foot of 39,000 lbs. The piers which support the dome of St. Peter's at Rome sustain a pressure on each superficial foot of 33,000 lbs. The pressure on the keystone of the bridge at Neuilly has been estimated for each superficial foot at 18,000 lbs. In regard to these examples, we have to remark that the calculators of them have considered the pressures as uniformly distributed over the pressed surface; but this can only be true when the direction of the resultant of the straining force coincides with the axis of the pier or pillar; besides stones cannot be wrought absolutely level, nor bedded in perfect contact.

### Impediments to Sculpture.

R. WESTMACOTT, R.A.

In this country, sculpture, when it began to assume any position, may be said to have had its impulse from a very debased state of the art. We never had such a preliminary fundamental school as existed on the Continent. We began, as it were, with the mere imitation of the types of an entirely obsolete class of thought; and even then, we, unfortunately, had for our example but the inferior works of an inferior class of scholars and imitators. The commanding genius of Michel Angelo and other eminent sculptors dignified the art they produced, even though its style and false classical sentiment were not in accordance with the sympathies of the people to whom they were exhibited. But their less gifted followers helped still further the downward course of the art, by at last ignoring altogether the simplicity and the concentration that is, or should be, a characteristic of all good sculpture. Their object was to gain popular favour by the exhibition of daring execution and elaborate finish, in flying draperies, bold undercuttings, the close imitation of the commonest objects—as veils and nets—and in similar unworthy though ingenious puerilities. The miserable and fallen condition of sculpture after the time of Bernini—an artist of most powerful genius had it been rightly directed—and when the standard of excellence was the fanciful *tours de force* of Roubiliac and Rysbrach, seemed to render further debasement impossible. Yet these were the artists from whom the impulse of sculpture was received among us; and the indisputable merit of Roubiliac, in his own particular way, added to his immense popularity, had rendered the example still more attractive and pernicious. The few natives of England who professed the art offered no exception to the bad taste that had gained public approval and patronage; on the contrary, the prejudice that existed in favour of employing foreigners impeded the progress and improvement of our own sculptors, even had any one of them shown sufficient genius to strike out a better path for himself.

**Rustication.**

W. H. LEEDS.

Rustication, contrary to the idea the term itself at first suggests, so far from producing an air of rudeness, coarseness, or negligence, is not incompatible either with richness or delicacy of finish; or rather, accordingly as it is treated, and as the subject itself may require, it is capable of great diversity of expression, from that of stern massiveness to that of refined elegance. It is somewhat singular, therefore, that those who have professed to be of the Italian school should have confined themselves nearly to one single species of rustication, and have made use of that mode only for basements. Of late years it has been the practice to substitute for the more architectural form of rustication, the insipid fashion of making merely horizontal grooves or joints; which, instead of producing any richness of surface, or amounting to decoration, only occasions an excessive monotony, arising from so many horizontal lines. In some cases it is not otherwise of any moment than that the degree of effect, which might have been attained, has been lost, there being nothing else in the designs themselves to be injured by it; but this horizontal striping shows itself most flagrantly in the Goldsmiths' Hall, where it renders the whole of the ground floor utterly at variance with the rest of the building, which is as remarkable for its heaviness, and the somewhat exaggerated and *outré* character of its decoration, as the lower part is for its bareness, its tameness, and its insipidity. The same disagreeable contradiction shows itself in the façade of the City Club-house, where a very mediocre and commonplace specimen of Italian architecture is placed upon a striped basement.

**The Lotus.**

W. A. BROMFIELD, F.L.S.

The lotus flower and the papyrus have wholly disappeared from the rivers and marshes of Egypt: the rumour of the Papyrus still lingering in the vicinity of the Lake Menzaleh roving, it seems, a mistake, another species having been confounded with the true papyrus of antiquity, which is *Papyrus antiquorum*, *Cyperus papyrus* (Linn). Poor Egypt! how she has been shorn of all her boasted splendours, even to her very garlands of lotus flowers, and how literally have the words of the prophet been fulfilled in the single and apparently unimportant, as in so many more remarkable and weighty instances:—"The reeds and flags shall wither; the paper reeds by the brooks, by the mouth of the brooks, and everything sown by the brooks, shall wither, be driven away, and be *no more*." (Isaiah xix. 6, 7.) In like manner the lotus, once so celebrated and so constantly represented in Egyptian paintings, and popular as an architectural ornament, has quite disappeared from the Nile; and it is remarkable that in every part of this interminable river that I have traversed, from Alexandria to Khar-toum, a distance of 2,000 miles, I have not found half a dozen truly aquatic plants.

**Ancient and Modern Paints.**

R. LIEBREICH, M.D.

We meet very often with the idea that the old masters had been in possession of colours—that is, pigments—the knowledge of which has been lost, and that this accounts principally for the difference between the oil paintings of the fifteenth and sixteenth centuries on the one hand, and that of the eighteenth and nineteenth on the other. But this is a great mistake. We know perfectly well the pigments used by the old masters; we possess the same, and a considerable number of new ones, good as well as bad, in addition. In using the expression good as well as bad, I am principally thinking of their durability. From this point of view the pigments can be placed under three headings:—(1) Those which are durable in themselves, and also agree well with the other pigments with which they have to be mixed. (2) Such as when sufficiently isolated remain unaltered, but, when in contact with certain other pigments change colour, or alter the others, or produce a reciprocal modification. (3) Those which are so little durable that, even when isolated from other pigments, the mere contact of the vehicle, the air or the light, makes them in time fade, darken, or disappear altogether. The old masters used without reserve only those belonging to the first of these three categories. For those belonging to the second they imposed on themselves certain limits and precautions. Those belonging to the third they did not use at all. That some of the modern masters have not followed these principles is not owing to a lost secret, but to the fact that they disregarded those well-known principles, and even consciously acted against them. In Sir Joshua Reynolds's Diary, for instance, we read that in order to produce certain tints of flesh he mixed orpiment, carmine-lake, and blue-black together. Now orpiment is one of the colours of the second category, carmine-lake one of the third. That is to say, orpiment, as long as it remains isolated, keeps its brilliant yellow or reddish-

orange colour; but when mixed with white-lead it decomposes, because it consists of sulphur and arsenic, and it moreover blackens the white-lead, because the sulphur combines with it. Carmine-lake, even if left isolated, does not stand as an oil-colour, and therefore has been superseded by madder-lake.

**Ancient Colours.**

SIR M. D. WYATT.

The colours employed in the paintings of Pompeii have been subjected to chemical analysis, originally by the great French chemist Chaptal, and since then by Davy, by Faraday, and many other *savants*, down to M. Chevreul, and they have been found to be as nearly as possible identical with those used on the monuments of Greece and Sicily. In the investigations of the most eminent chemists, traces of organic matter have been found in all the colours of Pompeii and Sicily. The Greeks call that vehicle "Sarcocolla," and it appears, from the evidence of Sir Humphrey Davy and others, that it was little else than size. That such a material was used is evident, because although the lime would cause the lighter tints to adhere, it would be impossible to use sufficient lime in the parts intended to be of darker tints, to cause them to adhere, without lowering considerably the depth and beauty of the colouring. It is a curious circumstance that in the Egyptian colours a resinous composition has been found, which is in the nature of a varnish. In the colours of Greece we find wax, but no trace of lime; whereas in those of Sicily and Pompeii lime is, in all cases, found with the organic matter, and in those of Etruria without it. A similar absence of organic matter, and traces of the presence of lime, has been observed in analyses of the Gallo-Roman remains which have been found in France. The Romans divided their colours into the "austere" and the "florid." The early Greek artists had but four colours—white, red, black, and yellow—which were entirely composed of earths found in the neighbourhood of Athens. Subsequently "cœruleum," or blue, was discovered and used as a frit or smalt, consisting of carbonate of soda, with a little copper and some lime. The austere colours were in most common use, including the red which came from Sinope in Pontus. The Greeks appear to have brought these colours into fashion in Italy, because in our analysis of the Etruscan colours we find that such as were used in Italy, previous to the advent of Greek artists, were made from earths existing in the neighbourhood of the painted monuments, whereas those of Rome and Pompeii were brought from a great distance—from the Greek colonies, from Egypt, and other places. The principal colours used in Pompeii were red, usually the earth from Sinope; blue, or cerulean, which is the Egyptian frit, analysed by Sir Humphrey Davy; yellow ochre and white. For the latter, the ancients frequently used a white earth, or rather a sort of china clay, but in Pompeii it is found to consist entirely of lime.

**Contrasts of Colour in Nature.**

W. BARNES, M.A.

I have collected from time to time in my walks, within a rather small range, cases of the contact of sundry pairs of colours on natural bodies, and find of white and yellow ten or twelve cases in flowers and birds; white and orange, some cases, as in the petals of the horse-chestnut and in the orange-tip butterfly; white and red, in several plants, lepidoptera, and birds and eggs; white and purple, mostly in blooms; white and green, in ten or twelve species of plants, and among birds in the shoveller, wild duck, and peacock; white and black, in the bean blossom, some few insects, and nearly twenty species of birds; yellow and orange, in the corolla of the toad-flax and in the brimstone butterfly; yellow and red, in manifold cases of flowers, and in some coleoptera and more lepidoptera. Mr. Layard found a deep dull red, and a bright yellow mingled with black, much worn by a tribe, we believe, in Asia; they had good warrant for their choice of hues. Purple and yellow and yellow and blue are found together in some blossoms, and the blue of the sea and the yellow of the sand are a striking pair of hues in the wilderness of Sinai. Yellow and green, in more than twenty blooms, and a few coleoptera and four orders of insects; and some birds wear yellow and black. The lepidopterous insect, "*Colias edusa*," is bright with orange and green, and others shine in orange and black, while orange and purple and red and purple have tinted several kinds of flowers. Of red and green the cases are manifold in flowers, with the cicindela and curculio. Red and black mark flower, beetle and butterfly, as purple and green tinge many a shining petal. Blue and black are worn by several butterflies, and green and black marks the teal, the peacock, and the eggs of the guillemot. These cases of the by-setting of colours are but a very small share of an almost infinite multitude, as they have been gathered from the flora and fauna of a few miles, with a few foreign insects; but yet, as far as they reach, they seem to betoken some mark-worthy facts.

## NOTES AND COMMENTS.

A FRENCH imitation of *Vanity Fair* has at last appeared, with the title *Silhouettes Parisiennes*. It will contain weekly a portrait of some French notability, and the co-operation has been secured of M. CHARTRAN, who has drawn some of the portraits in the English journal. A calendar of fashionable events for the ensuing week will also be made a regular feature.

THE famous comedian REGNIER, who died last week in Paris, resembled the late CHARLES MATHEWS in being connected with architecture. But while the latter did pass through a state of pupilage, and, it is said, for a time tried to gain commissions, REGNIER was not competent to go through the first competition among students of architecture at the Ecole des Beaux-Arts. He had not the courage to try again, and abandoned architecture for the stage. During his career he created or appeared in over two hundred and fifty rôles. M. ESCALIER, the architect, was his son-in-law.

M. DE NEUVILLE has painted so many English military scenes that he can hardly now be considered a foreigner. After many months of acute suffering he is still unhappily an invalid. A few days ago M. DE NEUVILLE went through the form of marriage in his chamber with Mdle. MARESCHAL. The witnesses were his attached friends MM. DETAILLE, BERNE-BELLECOUR, LE BLANT, DUEZ, and ROGER JOURDAIN, the painters. Although still young, M. DE NEUVILLE has an European reputation, and his illness will excite general sympathy.

THE city of Epidaurus contained a temple of Æsculapius, and, from the commercial connections of the citizens, the building was able to attract patients from all parts of the world. It fulfilled the purpose of a modern German watering-place. According to a late account, an inscription has been found containing about three hundred lines, which is said to be a record of the sums expended on the construction of the temple. It is supposed to date from about the fourth century before the Christian era. In the course of explorations the head of a small statue of the god-physician was also found, and a part of another statue. Both are said to be of splendid workmanship.

M. BONNAT, the French portrait-painter, is to be made a commander of the Order of Leopold, in recognition of his assistance to the last triennial exhibition at Brussels, and MM. DELAUNAY, FANTIN LE TOUR, and HEILBUTH will be nominated among the chevaliers.

THE Marquis of BUTE has subscribed 500*l.* towards the erection of the new Catholic church which is to be built on the site of the existing building at Turnham Green. His lordship has an interest in the work, being the tenant of the Duke of DEVONSHIRE'S house in Chiswick; that famous villa where so many politicians used to meet, and where Fox and CANNING died. The present church is Gothic in style, but the new building, which is to be erected from the designs of Mr. KELLY, of Leeds, will be Italian or Roman.

THE mysterious property which is known to building labourers as "Sticktion" is not confined to this country. On the Continent it also aids in keeping structures together, in defiance of all the laws of the philosophers about the strength of materials. It has been discovered that a wall of the assembly-room of the Hôtel de Ville in Brussels is in parts half a brick in thickness. Yet this thin partition carried one of the iron beams which supported the public gallery, and during all the meetings there was no sign of vibration. The building is about to be entirely remodelled.

THE election to the art mastership of the Wolverhampton Art School has engrossed a good deal of attention from students in training and prospective candidates. The arrangements can hardly be said to show a recognition of the services of Mr. GUNN, who has been associated with

the old school from its commencement. There has been another meeting, and the General Purposes Committee of the Town Council, after reconsidering the question, have decided to adhere to their former recommendation—viz., for the Council to advertise for candidates for the post, urging that only by open and fair competition can the best man be secured. They consider, however, that if all things are equal, Mr. A. GUNN should have the preference. The School of Art and Art Gallery Committee have likewise again recommended that the post be advertised.

IT is recorded that King JOHN visited Kingston-on-Thames several times, and in 1200 granted a charter to the town. It is supposed that in the High Street there are remains of his "palace," but apparently there is no evidence to support the popular belief. His Majesty never remained more than a few days in the town, and was not likely to go to the expense of building a palace for transient visits. The house which is supposed to mark the site is about to be removed in order to erect new buildings, and a faint appeal has been heard against the barbarism. But there are so many buildings in and near London which possess an imaginary antiquity, that one like King JOHN'S palace may be removed without loss. A substitute can be created, if not in Kingston, at least in one of the neighbouring towns.

A "SAFE DEPOSIT" in Chancery Lane has been opened by Mr. THOMAS CLARKE, who is the fortunate possessor of 75,000 superficial feet of property in that important thoroughfare. The approaches and vestibules have nothing sepulchral about them, as they are lined with rich marbles and mosaics by Messrs. BURKE & Co. The writing-rooms are as pleasant as Japanese paper can make them. The strong rooms have been constructed by Messrs. MILNER, and weigh no less than 500 tons. They are divided into compartments, and the key of the renter as well as the key of the custodian will be required before one of them can be entered to remove the contents. The rooms are fully isolated, in order to admit of patrolling along the upper and lower parts as well as the sides. By an ingenious arrangement, the doors of the rooms cannot be opened unless at stipulated times. The position of the "safe deposit" has been well chosen, and there is no doubt it will prove a great public advantage.

IN the competition for the Lowestoft Cemetery Buildings the first prize has been awarded to Mr. WILLIAM DOUBLEDAY, of Birmingham, who has been instructed to obtain tenders with the least possible delay. Messrs. BELLAMY & HARDY, of Lincoln, have obtained the second prize. There were forty competitors. In the competition for the Wesley Chapel at Preston, the design of Mr. DAVID GRANT, of that town, has been adopted. The works are to be at once undertaken.

A RETURN has been published from which it appears that the cost of the Municipal Buildings at Leeds has been 105,164*l.* 6*s.* 10½*d.* From that sum must be deducted the cost of the site, which was 8,890*l.* If we take the items in round numbers, we shall find the following proportions:—Foundations, 6½ per cent.; superstructure, 60 per cent.; tiling, 4½ per cent.; heating, 4 per cent.; furniture, 8½ per cent.; architect, 4½ per cent.; clerk of works, 1½ per cent.; painting, 1½ per cent. The printing cost 350*l.*, while the lightning conductors amounted to only 75*l.*

TRAMWAY engines are so hideous, it is not surprising that a line of tramway is not always supposed to enhance the value of property in streets through which they run. The cable system was recommended in a paper read at the Society of Engineers on Monday, on the ground that it had proved itself possessed of a great many advantages over all other tramway motors, more particularly that no space in the street is occupied by the motor, whereas considerable space is taken up by horses or engines; and also in its power to accommodate sudden and great rushes of traffic, as no other system can possibly do; thus being the best caterer to the public, with a minimum obstruction to them, important points which cannot fail to claim public support.

JAMES EMBANKMENT.

CHITECT.

## ILLUSTRATIONS.

THE ARTS: THE GOLDSMITH AND METAL-WORKER.

WE publish this week one of the figures by M. EHRLMANN which he has designed as types of fine and industrial arts. The series has been recognised in France as among the best of the class. In this case much has been made of personal ornaments, and, if a comparison is made with some of the single figures in the Academy, which depend for much of their effect upon garish and commonplace trinkets, the advantages of the French system, by which jewellery is made an art, will be apparent.

DESIGN FOR A ROYAL MINT.

THIS illustration has been taken from a large water-colour drawing by Mr. FREDERICK SANG, which was exhibited last year at the Royal Academy. It shows the Royal Mint on a new site, namely, the Thames Embankment. It was the designer's aim to express strength, endurance, and security, and accordingly recourse was had to Florence for inspiration. To what extent he has succeeded he leaves the authorities and the public to decide.

ST. JAMES'S CHURCH, HAYDOCK, LANCASHIRE.

THIS design was prepared as an enlargement to the existing church at Haydock. It having been decided to retain the present building, it became necessary to plan the new part so that it would fit and work in with the old church. To do this it was proposed to take down the side wall, and to carry the roofs by means of a timber beam supported by wood pillars and brackets. In consequence of this arrangement, the height of the new nave was determined by the old structure, and there being no clerestory, or possibility of getting light at the west end, the side dormers were introduced so as to allow of larger windows to light the nave, &c.

A new site having been generously presented by the owner of the township, Mr. LEIGH, M.P., it has now been decided to abandon the idea of enlargement, and to erect a new church, for which plans are now being prepared by the author of the design illustrated, Mr. GEORGE SMITH, A.R.I.B.A., of Chester.

HOUSE, BECKENHAM PARK, KENT.

THIS house is being erected in a prominent position, and approached from a lodge, in the above park. The back elevation faces the large cricket and lawn-tennis ground. It is being built with red bricks and stone dressings. The roof will be boarded, felted, and covered with Broseley tiles. The verandah and balcony is designed to overlook the grounds and other very fine views. The architect of the building is Mr. GEORGE COOPER, of Beckenham.

## THE ARCHITECTURAL ASSOCIATION.

THE thirteenth ordinary meeting of the Association was held on Friday evening, the 24th ult., Mr. Cole A. Adams, president, in the chair.

On the proposition of Mr. H. H. Stannus, seconded by Mr. H. D. Appleton, a vote of thanks was awarded to the Entertainment Sub-committee in connection with the soirée. The list of nominations for the ensuing session was then read, Mr. R. C. Pink being nominated as president, and Mr. J. A. Gotch and Mr. W. H. Atkin Berry as vice-presidents.

A lecture was then delivered by Professor T. Roger Smith under the title of

## A Prism for Architecture.

Professor ROGER SMITH developed his subject under seven categories or heads, four of which, viz., floors, walls, roofs and openings, were essentials of buildings, the other three, columns, mouldings and sculpture, being optional. In speaking of floors, he described the old Roman plans as grand and complicated, that they were a people who had enjoyed great constructional opportunities, and that Christian architecture at first had largely depended on what the Romans had done. The first departure made by Christian architecture in the west from old lines was seen in the introduction of monastic buildings, though no startling innovation became apparent till the period of the Renaissance. While on the subject of floors

Professor Smith said it sometimes happened a building would be met with that had been two different buildings in different stages of its existence. Lately he had visited Malvern Abbey Church, once an enormous church, the Norman arcade of which still remained. Originally no doubt a low building, it had been altered, not in plan, but in height, which had been added to, and the impression produced now was one of height rather than extent, though there was no difference in the dimensions of the building. Ornament could not, to any large extent, be applied to floors. The grandest were to be found among the Roman mosaic floors and the tile pavements, sometimes very magnificent, of the Middle Ages. Westminster Abbey was possessed of one of Alexandrine mosaic on a very grand scale. The art of planning, as it was at the bottom physically, so also was morally at the root of all building.

Walls formed the second feature. The object of walls was threefold, viz., to enclose the floor, to carry the roof, and to form an object to be looked at from the outside and the inside of the building. Though the circumstances of plan determined the shape of the wall, whether it should be straight or curved, the outline was optional as regarded simplicity or complexity. Height, outline, and thickness were also optional, and the comparison of different buildings as to these points was interesting. The most handsome of all would be perhaps what we called the sky-line. In early times it was straight. The general outline of the Egyptian temples varied by the proportions given to the pylons. Among the Assyrians the outline, as far as was known, was straight, but in Greece a very remarkable innovation occurred in the pediment or gable, one of the most interesting features of the wall of a building, which once introduced was never abandoned, though varied in outline, sometimes flatter, sometimes steeper. In connection with the wall came the tower, mainly a Christian introduction. There were great towerlike buildings in Assyria, but the Egyptians had apparently not cared for the tower. It next developed into the turret, a feature such as was common in German churches, and the slender turret or minaret peculiar to Mohammedan buildings. In regard to the thickness of walls, as skill became greater, walls became slighter. An essential consideration in the construction of a wall was the foundation. It was the starting-point of every wall, and should receive the utmost possible attention. Any mistake made would tell afterwards, and at a time when to remedy it would be nearly impossible. The structure of walls varied immensely, as they had to be built of materials ready to hand. A wall consumed so much material, and the expense was so great if materials had to be brought far, that, as a general rule, materials within reach had been used, and so geology had dictated to a large extent the composition. In clay districts, bricks were used; failing clay, earth had been used, also flints—all which were abandoned for stone. The old Romans had employed artificial materials as bond, and wherever they could get stones the size of potatoes they could build. Brickwork went greatly out of use in the Middle Ages, especially in France. Its retention was mostly found in Italy, while the Gothic builders generally made use of stone. Then there was the construction of walls by combination of different materials, and to a large extent walls had been faced with materials more precious, or more specious looking, than that which formed the heart. As a rule, this construction was done very cleverly, but sometimes with such want of skill that it led to the ruin of the wall. But it was hard to find any wall that was of the same material all the way through. A wall comprised three divisions—base, body, and top. In the Greek temples the top would be an overhanging cornice. Bases were sometimes omitted, but a wall was seldom found without showing some indication of the base and marking of the top. A novelty to be noticed in Mediæval buildings was the buttress. The art of throwing the wall into piers inside was well understood of old, but the Gothic builders introduced a new constructional feature by throwing it on the buttress outside. Magnificent effects were got by shadow, and this was one reason why in all northern regions where the sun was lower the buttress once introduced was cherished and had flourished. In considering the roof, Professor Roger Smith said that in hot climates a flat roof was almost a necessity to allow people to get upon the roof. One reason for the gable in Greece was probably because the climate there was sufficiently temperate for people not to care about getting on the roof. Pitch of roof was influenced by the presence or absence of bad weather. Where there was much snow or rain the pitch was generally made steep, with a view to throw off the snow, &c. This principle became complicated in countries where, besides a considerable amount of snow and storm, the sun at certain seasons had great power. Switzerland was a case in point, and the roofs were comparatively flat, with great overhanging eaves to keep the house cool and provide shade, and moreover an important architectural effect was got by the shadows. Lastly, the roof-covering influenced the pitch, and therefore economy was generally the principal factor in determining it. The highest external development of the roof was the tower, and Mr. Smith alluded to the magnificent spire of Lichfield

Cathedral as an instance of the external roof in its glory. He also called attention to a cluster of German high-pitched roofs and a pair of curious towers at Angoulême, the roof of Westminster Hall, &c. Then an entirely new system of roofs was met in the permanent roof, leading to a series of developments in vaulting. In the Middle Ages the vault had been developed through a series of wonderful transformations till it reached its acmé in that of Henry VII.'s chapel at Westminster, and at King's College. Out of this grew another form of roof—the dome—the history of which was interesting to trace from old Rome to Byzantium to the greatest development at St. Sophia, in Constantinople. Western Christian architecture neglected the dome, and down to the time of the Reformation there was hardly any important Christian dome except that of Sta. Maria dei Fiori, at Florence. With the Renaissance the dome came more in use. Of those constructed, St. Peter's at Rome was the largest, and that of St. Paul's incomparably the finest. Mr. Smith alluded to the exquisitely beautiful Pointed Saracenic domes, both original and rich in design, and then pointed out the endless varieties of ceiling-work, all of which came under the head of roofing.

The fourth essential of building was the openings, which were to a building very much what features were to a human being. They were the inlets of impressions from without, and the outlets of expressions from within. The openings acted like features in giving architectural expression to a building. The great difference between trabeated and arcuated building, or, in other words, the difference between the lintel and the arch, came to the front in considering the question of openings as one of the most important developments in architecture. Limitations in regard of size or shape of openings naturally affected architecture. When the Pointed style came in, restrictions as to size or shape were removed. With the introduction of the arch, the whole system of architectural construction was altered, and had there been time it would have been interesting to speak of the great step taken when the arch passed from the hands of the Roman builders to the hands of the Gothic Mediæval builders. The decoration of every Gothic arch was by what Professor Willis had called building the arch in orders, or what might be called a recessed arch. The filling in of openings had led to most magnificent results. The tracery at the east end of Carlisle Cathedral was an example of one of the finest of traceried windows, and which showed perhaps the culmination and decline of this work. Pierced plates of marble of great beauty, grills of woodwork, &c., of simple design but exceedingly beautiful, were examples, among others, of modes of filling openings. The grouping of openings or fenestration became then an important matter, and took the place of grouping of columns.

Those were the four essentials of building. The next three features were optional. In the first place there were columns required for constructional purposes, just as posts were used to carry sheds. Many buildings had no columns, and in many that had them their use would have been dispensed with were it not for their beauty. The columnar style displayed an almost infinite variety, and columns in endless varieties might be picked out by going through all the old buildings. The Greeks grouped the column really under Doric and Ionic, which formed the patterns of nearly every column since. Pointing to the drawing of a Persian column, Mr. Roger Smith showed that the base of that column furnished the idea for the base of columns used in Asia Minor, and over a considerably limited field in various parts of Greece. That column had been the parent of all columns used since. When the arch came into use the column sank from its original position as an integral part of the building. If the Parthenon were robbed of its columns, the architecture would be lost. The Coliseum might be shorn of its pilasters, and would lose nothing. The subsidiary use of columns and the Decorated columns, the use of interior columns, and absence of exterior columns were referred to as new departures in the hands of Gothic builders. Columns were proportioned to the loads they were intended to bear. A main column in Durham Cathedral showed engaged columns about it that apparently had no duty, except that of carrying a moulding. There were nook shafts and vaulting shafts and shafts used with tracery—all examples of Decorated columns. Inside buildings, churches, cathedrals, &c., columns served to do important work, and looked extremely well. One other use of the column was the Roman isolated column for the purpose of a monument. Columns were often necessary and introduced constructionally. Ornaments were not. To pass over colour and colour decoration, ornament might be broadly classed in two groups, viz., mouldings and sculpture. The original *motif* of the moulding was to produce an outline or profile. The Roman cornice not only threw a shadow, but produced a great projection in the building. Secondly, an object attained in Gothic buildings was to throw a line on the building in a similar way as by use of the brush, the shadow being got from the hollow of the moulding. It was most important to design the size of a moulding in relation to its position as nearer or farther from the eye of the beholder. Moreover, the relation of

mouldings to other architectural forms, materials, and dates of buildings was full of interest. A member of the Association in its early days used to say that if put down in the dark in a Somersetshire church he could identify the building by its mouldings, and that was the kind of familiarity they ought to aim at in the great architectural field of work. As to the relation of mouldings to materials, a good surface could not be produced on stone. To get shadow the features must be well defined and bold. In the thirteenth century the mouldings were undercut to a remarkable degree. To go to the other extreme—namely, white marble—the mouldings were comparatively flat, but as good an effect was got from the flat and delicate mouldings in white marble as from the boldest mouldings in stone. Wood as a material did not give so lustrous a surface as marble. The treatment of wood lay midway between that of marble and stone. Constructionally speaking, we built with marble and with stone, but wood we fitted together. Mr. Roger Smith next referred to sculpture, which was sometimes incorporated, sometimes framed, in the architecture, examples of both kinds of treatment being given in Grecian architecture. He also mentioned architectural features formed by caryatides incorporated in buildings, which to a large extent were conventionalised to fit them to the building. He instanced the Erechtheum, and also the modern church of St. Pancras in the metropolis. Conventionalism was the term for expressing the agreement to accept part for the whole. Painters had a conventional representation of the human figure sufficiently suggestive of the figure to satisfy the eye. As to the use of carving for ornament, the Greeks, who were the fountain-head of ornament, took a certain amount from the Assyrians, and whatever they had touched had come down to us almost without exception. Ornament had sprung up and passed away again, but was there any secret to explain the Greek enrichments? Everything they touched became good in their hands, and had lived on to the present time. Mr. Roger Smith then by a sketch on the blackboard showed the principle or secret that produced this excellence, and observed that it was a principle of almost all Greek mouldings that the leading line, or one of the principal leading lines, of the moulding was the profile of the moulding itself. The lecture was concluded by remarks on colour, and after an allusion to ancient works, Mr. Smith said, as to our own Gothic buildings, it was difficult to determine the extent to which colour was used. He believed colour of no great brilliancy was used in many buildings, but then we had had the best of all colour decoration in stained glass, and if our buildings were less brilliantly coloured than others, it was because they were decorated with that beautiful glass which had fallen a victim to its own fragility or to the destructive agents of iconoclasm. He would merely add that no architecture was complete without colour. He had now gone through all the colours of his prism of architecture, and he would only say that if he had referred to something perhaps parallel to the seven lines of the rainbow, that the other lines of the spectrum had been ably treated by the greatest master of architecture in "The Seven Lamps of Architecture."

A vote of thanks, proposed by Mr. Slater and seconded by Mr. Blagrove, having been carried by acclamation, Professor Roger Smith replied, and the proceedings terminated.

## THE RESTORATION OF WESTMINSTER HALL.

THE Select Committee appointed to examine and report on plans for the restoration of the exterior of Westminster Hall have agreed to the following report:—

Your Committee was appointed to "examine and report upon plans for the restoration of the exterior of Westminster Hall." This reference was practically limited to the west side of Westminster Hall, which, by the recent demolition of the Law Courts, has been exposed to view, and to the north front of the Hall.

At the time when your Committee commenced their inquiry the only plans before them were those of Mr. Pearson, R.A., and the evidence received by your Committee has been mainly in opposition to or in support of them, although alternative plans were suggested during the discussion.

The question of the completion of Sir Charles Barry's plans for extending the Houses of Parliament in front of Westminster Hall, and on the site of New Palace Yard, was not in terms referred to your Committee, but, as their inquiry proceeded, it became evident that it would be necessary to consider those designs, as the treatment of the Hall would largely depend upon any conclusions arrived at with reference to them.

Sir Charles Barry proposed to erect two wings to the Houses of Parliament, similar in character and treatment to the existing front of the House of Lords in Old Palace Yard, the one extending from St. Stephen's Porch in front of and parallel to the west side of Westminster Hall, and joining at the north-west

corner of New Palace Yard another wing from the Clock Tower along the south side of Bridge Street. These two wings were to enclose New Palace Yard; at their junction there was to be a lofty and very ornamental gate tower.

The west front of Westminster Hall would be completely concealed from Parliament Square by these buildings, and the Hall would abut upon a court between it and the proposed western wing of the palace. This court was appropriated as a covered place for carriages.

Sir Charles Barry also proposed to raise the roof of Westminster Hall, and to raise the towers on the north front, so as to bring them into direct harmony with his building.

These plans also involved the removal of St. Margaret's Church to a position on the west side of Parliament Square, at a cost of 18,000*l.*, for otherwise the roadway between the new wing and the church as it now stands, would be inconveniently narrowed.

Mr. Charles Barry requested permission to give evidence before your Committee, and proposed a modification of his father's plan, in which this wing is thrown back nearer to Westminster Hall, but this is only to be attained by narrowing very much the courtyard between the wing and the Hall, so as seriously to interfere with the light to the rooms of the new building looking into this court, and by removing one of the flying buttresses, and blocking up two of the windows of the Hall at its southern end.

The cost of Sir Charles Barry's buildings was estimated at over 500,000*l.*

In 1865 the Government of the day, with the approval of Parliament, abandoned all intention of carrying out this scheme.

Money was voted for covering with stone the lower part of the western face of the clock tower, which had been left in brick by Sir Charles Barry, with a view to this scheme, and for surrounding New Palace Yard with the present elaborate railings.

It has been suggested by Mr. Ayrton that this abandonment did not apply to the whole scheme, and that it would be desirable to carry out so much of it as involves the erection of the wing in front of the west side of Westminster Hall. He admits that there is no present need connected with the Houses of Parliament or the public service for such a building; but he would not advise the construction of any work which is inconsistent with the future completion of it. He considers that Westminster Hall, as now disclosed to view, is "merely a gigantic barn, and a perfect eyesore in connection with and relative to the Houses of Parliament," and that it would be desirable to conceal it from view by the erection of a building in front of it.

This view is not that of several eminent architects who have been examined before your Committee, and who have expressed the opinion that the grand and severe lines of Westminster Hall combine well with the more florid work of Sir Charles Barry; and that it would be a grave mistake to erect any building in front of it so as to shut it out from view.

No attempt has been made to show any necessity for such large additional accommodation as would be provided by Sir C. Barry's plans, and the evidence before us of the chairman and of Mr. Ayrton points in the contrary direction. The chairman stated that, according to his view, there was no very serious demand for fresh accommodation in the Houses of Parliament which could not be met by rearrangement of the rooms already existing under the roof of the House.

Upon the whole, then, your Committee have arrived at the conclusion that neither architectural consideration for the group of buildings as they now stand, nor utilitarian reasons connected with the wants of Parliament, or of the public service, require that Sir C. Barry's wings, or either of them, should be erected.

A great deal of very interesting evidence has been brought before your Committee as to the condition of the west side of Westminster Hall at different periods, and as to the relative position of the buildings which undoubtedly adjoined it. This evidence was, as might be expected, conflicting upon many points, but your Committee do not think it necessary to dwell upon it, as so much of it bears but indirectly upon the questions referred to them.

Your Committee are, however, satisfied upon three points which are of importance in considering the question of the restoration of this side of the Hall.

1. That the Hall was intended by the original builders to be seen, although buildings of different heights soon sprung up beside it.

2. That at some time, probably, as your Committee think, in the reign of Richard II., a two-storeyed building was erected, underneath the flying buttresses, along the whole length of the Hall, with the exception of the two northernmost bays, the flying buttresses being built at the same time to support the splendid wooden roof then erected.

3. That at the north-western end of the Hall, facing New Palace Yard, a building stood at right angles to it, erected in the time of Henry III., and subsequently modified in Tudor

times, in the upper part of which was the room long occupied by the Exchequer Court.

Your Committee are further agreed that it is most desirable to preserve the ancient Norman work, erected in the time of William Rufus, on the lower part of the western wall. The stones are in perfect condition, and are covered with marks and signs of the Norman masons of that date; and as this stonework is one of the few specimens of that kind now existing, it should not be left open and exposed to the action of the London atmosphere, by which it would be speedily destroyed.

The perfect preservation of this masonry to the present time has been due to the fact that from the time of Richard II. it was covered over by buildings already referred to, which existed under the flying buttresses, and against the side of the Hall.

The investigations of Mr. Pearson have disclosed the foundations of a gallery or building in this position, extending nearly the whole length of the Hall. The height of the wall of this building is clearly indicated by the returns on the existing buttresses; that the building was double-storeyed appears from many indications, and was admitted by every witness but one before the Committee. The intervening floor and the roof were supported by arches erected on the side of the Norman wall, and resting on the old Norman flat buttresses, while all the extant plans made by Sir Christopher Wren and later architects and archaeologists, show that there were two storeys of rooms in connection with the Hall and the surrounding buildings, of which the upper floor was approached by stairs in the Hall itself. The only matter in doubt as to this building is the number and nature of its windows. Mr. Pearson suggests that in the lower storey there were arches, and that the upper floor was lighted by windows of two lights similar in design to the upper windows of the Hall. He admits, however, that the number and arrangement of them are conjectural on his part.

Turning then to Mr. Pearson's plans, your Committee find that he proposes to construct a double-storeyed gallery under the buttresses, following exactly the lines of the original building, and inserting in it windows which he considers in general harmony with and suited to the present requirements of the building. Finding also extreme difficulty in carrying on the gallery to the north end of the hall, and terminating it in a satisfactory manner, he proposes to erect a building at right angles to the Hall and facing New Palace Yard, in character with the work of Richard II., on the foundations of that previously referred to. He justifies these constructions on grounds architectural, archaeological, and utilitarian; he believes that by adopting them we shall recover the general aspect of the Hall as it was in early days.

He considers that a massive wall connecting the buttresses is necessary as a support to them and to the Hall itself, the western wall of which is not sufficiently strong.

He proposes that the two storeys of the gallery shall be divided each into four rooms; the dimensions of those in the upper storey will be about 40 feet by 20 feet, and 14 feet 6 inches to 17 feet in height, and of those in the lower storey about 38 feet by 19 feet 3 inches, and 13 feet 6 inches in height. It is proposed that the lower part of the building, at right angles to the Hall, on the site of the present shed, shall be used as a stand for horses, and that the upper part of it shall form a large room, communicating with the upper storey of the gallery.

These plans have been strongly opposed by witnesses before your Committee, some of whom represent a distinct school of archaeological opinion. These gentlemen object in principle to any attempt to restore or reconstruct on the lines of buildings which existed in former days. Any additions to or restorations of an old building such as Westminster Hall should, in their opinion, be of a markedly modern character; and, so far from being in harmony with it, should be purposely made incongruous, so as to show distinctly that they are modern work, and not imitation or restoration of what formerly existed.

Much of the evidence of these witnesses has been directed to criticisms of Mr. Pearson's plans, which they consider to be inaccurately described as restorations, on the ground mainly that the form of the windows in the proposed gallery is conjectural. Mr. Pearson has fully admitted this, and also that the building which he proposes at the north-west corner of the Hall is not a reproduction of that erected in the time of Henry III.

These witnesses admit the necessity for erecting under the flying buttresses of the Hall some structure suitable for protecting the old Norman wall from the action of the London atmosphere, but they object to the building being such as to revive or recall the past aspect of the Hall. They think that it should be as distinct and different from the character of the Hall as possible. The solution most favoured by them was, that a gallery should be erected under the buttresses and against the wall, at a distance of only eight feet from it, of wood and plaster, after the style of old buildings in Cheshire and elsewhere, the wood to be painted black and the plaster-

work white. Two rows of square-headed windows, it is proposed, should be inserted in this structure. No use is to be required of it further than to preserve the face of the wall.

This alternative treatment of the Hall has been condemned in the most emphatic manner by the eminent architects already referred to, who concur generally in the proposals of Mr. Pearson. Some difference of opinion existed among them as to whether the building under the buttresses should be of the height suggested by him. Mr. Waterhouse stated his strong preference for a lower building, on the ground that it would leave open to view more of the upper part of the wall and its range of windows, and also the upper parts of the flying buttresses; and Mr. Christian appeared to incline to the same view, though he admitted that the question of taste was evenly balanced.

At the suggestion of the Committee, Mr. Pearson made an alternative design for a lower building, showing more of the buttresses, and models of both plans in canvas have been erected on the side of the Hall itself, each showing two bays, with the galleries and buttresses as proposed. Both Mr. Waterhouse and Mr. Christian, on seeing these models, desired to be recalled before the Committee, and expressed a confident opinion that Mr. Pearson's original plan was the best, for the reason that it gives greater dignity to the side of the Hall than the lower building, while it leaves open to view from a distance more than they expected of the upper line of windows and of the flying buttresses. Mr. Pearson has also strongly expressed his preference for his first designs. It is to be observed that in the alternative plan the lower storey is necessarily reduced to a mere cellar, eight feet only in height.

Your Committee, after careful consideration of the evidence and of the models of the buildings erected on the side of the Hall, are of opinion that Mr. Pearson's original design for a two-storeyed building under the flying buttresses should be carried out. Considering, however, the desirability of obtaining, consistently with the adoption of this original plan, a fuller view of the windows of Richard II. and of the arches of the flying buttresses, your Committee suggest for consideration that the wall of the two-storeyed building should be somewhat lowered, and that a plain coping should be substituted for the battlemented parapet. There is, they may observe, no direct evidence that the original wall had parapets, though in the opinion of Mr. Pearson and others, the evidence points in that direction. A slight modification of this kind would certainly bring the windows of Richard II. considerably more into view, and would not, so far as your Committee can judge, injure or detract from the general effect of the building. Mr. Pearson has submitted to your Committee a drawing showing the arches in the lower gallery, with traceried windows, recessed from the plane of the wall. Your Committee approve of this suggestion.

The upper gallery of the building under the buttresses may be divided into four large rooms of sufficient height, approached by steps in the corners of the Hall, or from the lower gallery. These rooms will be conveniently situate for conference rooms or deputation rooms for members, or would be equally useful for Royal Commissions. The lower storey may also be divided into rooms, or may be left as a gallery where the Norman walls would be open for examination by those interested in archæology.

Your Committee also, in view of the opinion expressed by Mr. Pearson, that the proposed building at the north end of the Hall will form a fitting termination towards New Palace Yard of the gallery between the buttresses, and also of the favourable opinions expressed by some of the principal architects examined, are prepared to approve of it. Such a building can be fully justified on utilitarian grounds, as it will supply an indispensable need of the House in a stand for horses and other purposes, in place of the present shed. It has been represented to your Committee that it would be most difficult to provide for these wants in any other way that would be satisfactory. The large room in the upper part of this building may be used in connection with the gallery under the buttresses; as it is proposed to be lighted by windows on three sides, your Committee cannot doubt that the difficulty which has been suggested, that effluvia from the stand below would limit its use, may be easily overcome.

Your Committee have considered the proposal of Mr. Pearson to remodel and raise the towers at the north front of the Hall. It is admitted by Mr. Pearson that these alterations "cannot be based upon any reference to history or past record, but are almost demanded by the extreme ungainliness of the existing front," which, he adds, "has an air of spuriousness." Some of the witnesses considered it very desirable that Mr. Pearson's proposal should be adopted; others, while much admiring the design, did not apparently attach much importance to this alteration; while others were decidedly opposed to it. Upon the whole, then, looking to the conflicting nature of the evidence, and to the fact that the raising of these towers is not an essential part of the scheme, your Committee are of opinion that it would be well to postpone any decision upon

this part of Mr. Pearson's designs until the effect of the proposed building at right angles to the Hall, both in respect of the existing towers and of the west side of the Hall itself, can be fully tested.

It remains only for your Committee to point out the cost of these various constructions.

The total estimate of the works by Mr. Pearson is 35,300*l.*; of this 5,000*l.* is the cost of completing the corner of St. Stephen's Porch, in harmony with Sir Charles Barry's work. This is indispensably necessary if it be determined not to construct the wing of the Palace in front of the Hall, as proposed by Sir Charles Barry.

Eight thousand pounds is the cost of rebuilding and repairing the flying buttresses, and of effecting necessary repairs to the western wall of the Hall; this also is absolutely necessary, whatever plan is adopted.

Eight thousand eight hundred pounds is the estimate for raising the two towers on the north front, as proposed by Mr. Pearson; but this estimate may for the present be left out of consideration, if the work on these towers is postponed, as above recommended.

There remains 13,500*l.* as the cost of the two-storeyed gallery under the cloisters and the buildings at right angles to the Hall, and for which, looking at the question from a merely utilitarian point of view, there will be obtained a number of excellent rooms available for the purposes above referred to.

Your Committee consider it desirable that the date, or some other distinctive mark, should be placed on certain of the stones, so as to prevent any misapprehension arising hereafter as to the date of the work.

Your Committee, in conclusion, desire to express their sense of the great care and knowledge exhibited in his treatment of this most difficult subject by Mr. Pearson, who is admitted to be a most competent authority for such works, and whose plans are supported by some of the most eminent architects of the day; and while, on the one hand, your Committee do not contend that his design is an exact reproduction or restoration of the west side of the Hall, on the other hand, they feel assured that it has been prepared with careful regard to all historical evidence, and that the general scope of his design is in harmony with the simple grandeur of this national building.

"Antiquity after a time has the grace of novelty."—HAZLITT.

### THE NEW ARCHITECTURAL ROOM OF 1837.

ON April 29, 1837, His Majesty William IV. opened the rooms in the National Gallery, Trafalgar Square, which had been assigned to the Royal Academy. They were distinguished by the names *East Room*, *Middle Room*, *West Room*, *Drawings and Miniatures*, and *Architecture*. Sculpture was in the room on the ground floor, but, bad as it was, it was superior to the closet in Somerset House where the exhibitions of the Royal Academy had been held from 1780. The architectural drawings were criticised by Mr. W. H. Leeds, in an article which we consider to be worth reprinting at a time when architecture has again changed its quarters, and become the occupier of a new room in the premises of the Academy:—

Just returned from the Academy's exhibition, which, as far as the architectural drawings are concerned, is altogether the very worst I have yet seen during the whole course of the time I have been in the habit of visiting it; that is, for the last sixteen years. One might almost imagine it to be the intention of the Academy to throw architecture overboard altogether, by bringing it into disgrace, and disgusting the public with such specimens of it. Elsewhere are the miserable things we this year meet with—I will not say hung up so as to be thrust just before our eyes, but wherefore are they admitted at all? It will be said, it is not the fault of the Academy if better designs are not sent in. Undoubtedly it is not; yet, although it does not possess such authority as will compel architects to offer good drawings, it certainly has the power of rejecting bad ones; and, that power being possessed, it might be conceived that policy alone, to say nothing of decency, would induce the judges to exert it in a case like the present. Is it, I would ask, by receiving any rubbish, so long as a vacant space can be found on the walls to hang it up, that the Academy either consults its own dignity or discharges its duty? Does it conceive that it encourages art, or does it in any degree attend to its interest by admitting, and thereby countenancing, works of sheer imbecility? So far from adopting such a degree of judicious severity as would render it in some respect honourable, at least creditable, to have a work received into the

exhibition, the Academy has this year virtually proclaimed that nothing (in architecture, I mean, for it is of that alone I am speaking) can be too vile, or too preposterously absurd, for acceptance. Or is it to be imagined that, whatever may be the case with regard to paintings, works of architecture are considered as out of the pale of the Academy's jurisdiction, and that it is no one's business to sit in judgment beforehand on the architectural designs, and to weed out from among them, at any rate, such as are absolutely disgraceful. If this be any excuse, the Academy is perfectly welcome to it; though, in itself, it is nothing short of damnatory, as it cannot be made use of without convicting that body of being, as far as concerns one of the fine arts it is intended to promote, not only useless but positively mischievous.

This language runs the risk of being deemed too fiercely severe. Beforehand, I grant it may seem to be so; but it will not be thought more than just by any one who has looked at those two architectural abominations, Nos. 1006 and 1054. In one word, it is a downright insult, both to the architectural profession and to the public, to hang up such truly infamous performances. Truly, the Academy has opened its new exhibition rooms with works of most propitious augury for architecture, and most creditable to the present state of that art in this country! The only comfort left us is, that the very enormity itself will tend to bring about some reform, by exciting such strong, if not general, animadversion as may induce the Academy to show henceforth a little more discretion and decency. If the Royal Academy has no regard whatever either for the interests or the honour of architecture, why do not our architects emancipate themselves from it altogether? Why does not the Institute, if it be really anxious to vindicate the dignity of the art itself, and to promote a right feeling for it among the public (as it is obviously for the direct interest of the profession itself to do), establish an annual exhibition of its own; not one that is merely the fag end, as it were, of an exhibition of pictures, but which should be on an independent and adequate footing? which should, besides, consist of something more than picture-drawings and elevations, and wherein some kind of classification, both as regards the style of execution and the subjects themselves, should be observed? But *revenons à nos moutons*.

A very cursory examination of No. 1038, *Design for the New Houses of Parliament*, by L. N. Cottingham, will convince any one that the charge which has been brought against Mr. Barry, of having pirated from it, is most preposterous, unless he has discovered the philosopher's stone, and the art of transmuting architectural lead into gold, tastlessness into beauty. The most that can be said in its favour is that it is not altogether such an extravaganza as Gandy's *British Legislative Mansions*, No. 1035. Although with no pretensions to architectural importance (it consisting of no more than a few piers and railings), No. 1044, *Design for the Entrance to the Old or Royal Well Walk, Cheltenham*, now erecting, &c., by T. Bellamy, is one of the most pleasing and tasteful things in the room; and it proves that, if an artist possess real talent, he will make it display itself, let the subject itself seem ever so unpromising; while, on the other hand, there are many who aim at the most ambitious fancies—huge national buildings, &c.—yet, at the same time, plainly show they possess neither the invention nor the ability to design a door or window. In this latter class we may fairly put down Mr. Vulliamy (would that we could as easily put down the whole of the class itself!), who exhibits to us, in No. 1119, the *Proposed new Front for the Royal Institution*. Now, although the building in Albemarle Street is at present of the most homespun description, it has, at least, the negative merit of not being ridiculous, which it certainly would become, and not a little offensive withal, should it ever be improved according to Mr. Vulliamy's recipe. There are three ranges of windows, thirteen on a floor; consequently, unless the whole front were to be entirely remodelled, these numerous apertures must determine its character, and, if they cannot be got rid of, ought to be rendered attractive as well as indispensable features. Yet what does Mr. Vulliamy propose to do? By what happy stroke of invention does he think to transform this dowdy in brick and mortar into a piece of Grecian architecture? Why, by sticking up fourteen Corinthian columns against the piers! Really, if we cannot get beyond such vile sophistications and adulterations, such extravagant dulness, we ought either to go to school afresh, or else abandon Grecian and Roman architecture altogether. At any rate, should the Royal Institution accede to this architectural proposal, it will deserve to be formally anathematised by the Institute. One thing is quite certain, that Mr. Vulliamy has not the fear of Welby Pugin before his eyes.

The designs by the new professor of architecture (viz. 1014, 1016, 1022, for a *Metropolitan Hospital*, and 1034, a *Triumphal Entrance to the Horse Guards*) do not rise above respectability: they are pleasing, but display no extraordinary taste, still less any power of imagination. Gandy, on the other hand, possesses a superabundance of imagination, yet of the most ill-regulated sort, and almost, in fact, to the exclusion of

common sense. Were he and Mr. Vulliamy to bite each other, it might prove greatly to the advantage of both; for the one would probably be chilled into propriety, the other kindled into some degree of fancy.

No. 1005, an *Interior View of the Arcade beneath the Viaduct of the Westminster and Greenwich Railway*, by D. Paine (of which, by-the-by, there was a lithograph engraving published some time back), manifests much greater taste and propriety, and cleverness of application, than many subjects which seem to afford far greater scope for design. There is likewise a good deal of effect in the drawing itself, which is more than can be affirmed of the generality of those exhibited this year; for many of the designs are very poor indeed in their drawing and wretched in their colouring. Sections are prohibited, very properly so, it is to be presumed, as being absolutely unintelligible to the multitude, and altogether superfluous and uninteresting to architects; and interiors might as well be in the same predicament; for, except a few views from old churches, and buildings of that description, there are not above two works of that class in the room—namely, designs for a synagogue. Stay, there is a third, which, the catalogue informs us, is a staircase for a royal palace; but it is placed where it would require another staircase, or at least a ladder, to mount to it, in order to make out what it is. Perhaps we lose nothing by its being so elevated, while the catalogue is a gainer by its being received, along with many other things of the *nos numeri sumus* class, this year a tolerably numerous one. Really, the Academy still requires to have another professorship, and it should appoint a professor of hanging against next season. Of the two designs just mentioned, both of which, it may be presumed, were for the same purpose, No. 1051, *View of the Ark of the new Synagogue in Great St. Helens*, by J. Davies, is decidedly better than No. 1125, *Design for the Interior of a Synagogue*, by D. Mocatta, and that, too, both as regards the drawing itself and the architectural composition. It is, indeed, coloured in a very clever and picture-like manner, more so than almost anything in the room; and there is so much brilliant and scenic effect in the general arrangement, and some of the ideas, that we cannot help feeling pleased with it, though it is not so well studied in all its parts as it might have been; for, taking the features separately, there are some which by no means evince either a correct or an elegant taste.

Among designs adopted for execution, that by Mr. Basevi (1069), for the front of the Fitzwilliam Museum, at Cambridge, towards Trumpington Street, deserves attention, were it only for the importance of the subject. Although it cannot lay claim to any striking originality, it is a very fair composition, consisting of an octostyle Roman Corinthian portico, with three open intercolumns adjoining it on each side, where it projects beyond the general mass of the edifice, similarly to the Royal Institution at Manchester. The façade is completed by a single inter-pilaster at each extremity. The whole, consequently, consists very nearly of columns disposed upon two lines; a mode which not only produces greater richness, but is a deviation from the ordinary one, of placing a portico against a building. The absence of windows will also give a Classical character to this façade: yet it may be questioned whether it will show itself to the same advantage as in the drawing; because, as it will face the east, the whole will be in shade during the greater part of the day, and much of the effect here given to it must be lost. Surely, the architect might have contrived to admit light into the portico, either from above or on the west side, so as to obtain some degree of brilliancy in the centre, where the columns would have relieved themselves against a light background—that is, an open vestibule, so lighted, seen beyond them. No. 1096, one of the four designs selected by the University of Cambridge for the Fitzwilliam Museum, by E. Lapidge, a name quite new to me, has considerable merit; and, owing to the statues and sculpture introduced in it, announces itself more distinctly as a public museum. It has also a dome, an architectural feature in which Cambridge is at present deficient; but, in itself, it is not of the best form that might have been selected. This design is more extensive than Mr. Basevi's, and is apparently intended to occupy the entire length from north to south; whereas the other seems a centre, to which wings may afterwards be added. Whether it was this circumstance which occasioned the final decision in its favour, it is hardly possible even to conjecture, there being neither plan nor sections of any kind, from which we might judge which architect has shown greater taste and judgment in the interior. In this respect, it is to be hoped, Mr. Basevi's design will, when executed, be found perfectly satisfactory. *Ad interim*, such hope ought to be tempered with a little mistrust, it being more prudent, in all cases, not to suffer one's expectations to be over-sanguine.

Again, I am tempted to ask, Why do not either the Institute, or the architectural profession as a body, emancipate themselves from the leading-strings of such a cross-grained dry-nurse as the Royal Academy shows itself to be towards them; shake off the arbitrary and whimsical restrictions it

imposes upon them; and establish such an annual exhibition as would do them credit? Are they so totally devoid of all spirit of independence as to be content to jog upon a pillion behind the painters? Or does it arise from pusillanimity and a cowardly mistrust? As a mere speculation, such an exhibition might probably not answer; at least, it might be some years before it would even pay its own expenses. What then? Has art no more generous speculations? Is it not only to attempt nothing save what promises to be a profitable ready-money concern, but ought no sacrifice whatever to be made for the sake of promoting its interests?

Leaving those whom it may at all concern, either to answer, or, if they cannot answer, to ruminate upon the above queries, I will proceed with my examination, or, rather, now hasten to terminate it, by pointing out one or two more drawings, that prevent the Academy's architectural room being this year a mere blank: I might say worse than a blank, since the bare walls would hardly be so discouraging a sight as most of the things now hung up upon them. Nos. 1093 and 1111, the *North Lodge at Chequer's Court, Bucks.*, the seat of Sir Robert Frankland Russell, by E. B. Lamb, show that *con amore* taste and feeling which give vent to, and find scope for, themselves in the most limited subject. So-called picturesque cottages are, for the most part, equally abominations to the painter and the architect; but the one here represented is particularly happy, and not least of all so for the effect produced by the variety of materials and their colours, as well as for the expression of form. No. 1118, the *Red Maid's Hospital, Bristol*, C. Dyer, is a very good application of the Tudor style. There is also much merit in No. 1133, *A Baronial Mansion in the County of Surrey*, now erecting under the superintendence of B. Ferrey. The gateway tower comes in well in the drawing; and the house itself, which is, like the gateway, of red brick and stone, is of a quiet unostentatious character, with little of embellishment, yet far more pleasing than those overdone attempts at old English architecture where showy, but ill-studied features are put together in such a manner as to betray no feeling whatever for the style itself.

I had hoped that Mr. Cockerell would have allowed us to see something of the buildings he is about to erect at Cambridge; but he has not a single drawing this year; neither is there anything by Barry, and many others who have hitherto generally exhibited; nor has any one ventured to attempt, even upon paper, any specimen of polychromy, notwithstanding that it is a subject which would seem to have engaged the attention of the Institute. In fact, whatever good the Institute itself may be doing, there is not the slightest manifestation of it here; for, as far as design goes, there is this year a most terrible falling-off from the average architectural talent which used to be shown at Somerset House.

### EDINBURGH ARCHITECTURAL ASSOCIATION.

THE members of the Edinburgh Architectural Association on Saturday visited Ravenscraig Castle and Dysart House, the seat of Lord Rosslyn, under the leadership of Mr. John M'Lachlan, architect. On arriving at Sinclartown the company proceeded direct to Ravenscraig, in the immediate neighbourhood, where Mr. M'Lachlan read a paper descriptive of the views, which he illustrated by drawings. Ravenscraig, he said, was one of the most interesting castles in Scotland. It was the project of James II., who, however, did not live to see the work commenced, but it was begun in 1460 under the auspices of his widow, Mary of Gueldres. The castle consisted of two round towers or keeps facing the land, and connected by a curtain of low buildings. It was unassailable from the sea by the perpendicular cliff on which it stood, and was protected on the land side by a deep moat. The battlements were splayed away in solid masonry in a most unusual manner, and there was no sentry walk nor embrasures. The only explanation of that peculiar arrangement he found in the presence of elevated ground landward, which would have rendered futile a defence from battlements in the ordinary way. The besieged would, therefore, rely on the massive strength of the walls, and the sloping battlements would present to the besiegers a surface difficult to injure. After pointing out in detail the architectural features of the ruins Mr. M'Lachlan said it was matter for regret that such a notable, and in some respects unique, castle was rapidly crumbling to decay. It would not, he thought, be out of place if the Architectural Society were to make a respectful representation to the noble owner, the Earl of Rosslyn, to take steps to prevent further disintegration. Their representations regarding Craigmillar Castle had resulted most satisfactorily, and they had good ground for hoping, from the well-known regard which Lord Rosslyn showed for other noble edifices, such as Roslin Chapel, that their action in this case might not be without good fruit. On leaving Ravenscraig, the company walked through

the policy of Dysart House. Here they were met by Mr. Thomson, chamberlain to Lord Rosslyn, and under that gentleman's guidance the party examined the treasures of Dysart House, including a large collection of notable pictures and some beautiful wood furniture. Mr. Thomson afterwards conducted the company to the interesting caves which open off the garden of Dysart House, and thereafter through the most interesting part of the quaint and picturesque town of Dysart. A considerable number of houses of undoubted authenticity, dating from 1560 and 1580, were pointed out. These are of the picturesque character, with crow-stepped gables, broken string courses, and outside stairs. After according a vote of thanks to Mr. Thomson and Mr. M'Lachlan, the party returned to Edinburgh.

At the meeting on Monday, Mr. John Macrae read a paper on "Furniture," in which he referred to the great advance in matters of taste during the last quarter of a century. Education had, he said, made itself felt in every direction, and people now aimed at displaying their taste rather than their wealth in the furnishing of their homes. In keeping with this change of feeling, there had been brought about an entire revolution in the design and manufacture of house furnishings. Speaking of the fashions in furniture, he said the nineteenth century might be called the age of revivals and adaptations. Comparing the factory system with the old style of hand labour, he maintained that more character and better work were secured under the latter. As a manufacturer of furniture he regretted, along with other manufacturers, that the most beautiful woods had for long been excluded from use owing to the prejudice against veneering. His belief was that veneer, when properly placed in panels and protected positions, was not only enduring but beautiful, and in support of this he pointed to existing specimens of Chippendale, Sheraton, and others. Having referred to Talbert's influence, and the desirability of architects and house-furnishers acting in sympathy and co-operation, with the view of securing unity and completeness, Mr. Macrae gave a short sketch of the furniture of the period of Louis XIV. and XV., and concluded with a reference to the latest revival—"Anglo-Moresque." The paper was illustrated by sketches of various kinds of furniture, and at the close Mr. Macrae was awarded a cordial vote of thanks.

### GLASGOW ARCHITECTURAL ASSOCIATION.

THE first of the ordinary monthly meetings was held on Tuesday in the rooms, 114 West Campbell Street, when a paper on "Expression in Architecture" was read by Mr. John Keppie. There was a good attendance of members, and the President occupied the chair. The evolution of historical national styles was considered ere a comparison was drawn between some of these and the present cosmopolitanism exhibited by our modern buildings—a comparison rather unfavourable to the generally received character of steady, thorough-going, and wholly unsentimentalism of the British art public. An interesting discussion, opened by Mr. Boston, followed.

### THE NATIONAL GALLERY.

THE annual report of the Director of the National Gallery to the Treasury for 1884 has been issued. The pictures purchased during the year, it appears, were the following:—*The Assumption of the Virgin*, by Matteo di Giovanni di Bartolo; landscape, *The Calling of Abraham*, by Gaspard Dughet (Poussin); *The Adoration of Magi*, Venetian School; *The Pilgrimage to Canterbury* (after Chaucer), by T. Stothard, R.A.; *On the Ouse, Yorkshire*, by George Arnald, A.R.A.; *View of Harlech Castle, and surrounding Landscape*, by James Ward, R.A.; *Portrait of Miss Fenton, the Actress, as Polly Peachum in the "Beggar's Opera"*, by William Hogarth; *The Shrimp Girl* (sketch), by William Hogarth; *The Crucifixion*, by Antonello da Messina; *Portrait of a Jesuit*, by W. Van der Vliet; and *Portrait (supposed to represent Mary Wollstonecraft)*, by J. Opie, R.A. There were given as donations to the Gallery:—*The Nativity*, by Bernardino Cavallino (presented by Mr. Woodford Pilkington); *The Virgin and Child, with two Saints*, by Bonvicino; *The Procession from Calvary*, by William Blake (presented by Mr. F. T. Palgrave); and *Tartarus*, a satirical design, by James Callot (presented by Miss Appleyard). After giving an account of the pictures and drawings loaned to other institutions, more especially to provincial galleries, the report states that the total number of pictures now contained in the public rooms of the Gallery is about 950, exclusive of water-colour drawings. The report refers to the votes for the two great Blenheim pictures—that of 70,000*l.* for the "Ansidei" *Madonna* by Raphael, and the vote of 17,500*l.* for the equestrian portrait of *Charles I.* by Vandyck. These votes have been agreed to by

Parliament since the report was drawn up, but in view of the question which has been raised in that connection, we quote what the trustees and director of the Gallery have to say on this subject:—"It is confidently hoped that this vote will commend itself to the favourable consideration of Parliament, for although it may represent in its result a less extensive acquisition than the trustees and director originally hoped to secure for the National Gallery, it would be impossible to overrate the importance of adding to the collection two works of such rare value and extraordinary interest as the masterpieces in question. The satisfaction which the trustees and director feel at the prospect of securing those pictures has been somewhat diminished by an official intimation from Her Majesty's Treasury that, in the event of the vote being sanctioned by Parliament, the Lords Commissioners propose to suspend for a certain term of years the annual grant of 10,000*l.* provided for the purchase of pictures. It is respectfully submitted that such a course must be highly injurious to the interests of the Gallery, interrupting, as it would do, the continuity of acquisitions which can only be made from time to time, as favourable opportunities occur, and to defer which would mean to abandon them altogether. The trustees and director therefore take this opportunity of urging their lordships to reconsider a decision which will seriously check the growth of the collection and materially diminish its prospective value." With regard to the permission given to MM. Ad. Braun et Cie., of Dornach and Paris, to prepare a series of photographs from pictures in the National Gallery, it is observed that more than three hundred pictures, belonging respectively to the foreign and British schools of painting, have now been photographed on a large scale with complete success. The advantage thus secured to the public, both in England and on the Continent, of obtaining such admirable reproductions of the works in this collection is immense, and has, it is submitted, amply justified the authorities of the National Gallery in granting a privilege which, for obvious reasons, must be regarded as exceptional. As nearly as can be calculated, the Gallery was visited by 698,489 persons during the year.

In the spring of 1884 the first contract for building works necessary for the extension of the National Gallery was settled, and the foundations were dug shortly afterwards. The basement walls have since been carried up to the ground level, and Her Majesty's Office of Works has invited tenders for the second contract, under which the superstructure will be erected. It is earnestly hoped that no longer delay than is absolutely necessary will occur in the execution of this contract for the completion of the new galleries, which have long been urgently needed, and the necessity for which has been greatly increased by recent acquisitions. The plans for the extension of the building, which have been submitted to and approved by the National Gallery Board, include two new galleries, measuring, respectively, 92 feet by 40 feet, and 87 feet by 40 feet; two cabinets, each 30 feet by 20 feet, and a large staircase which, placed on the central axis of the building, will occupy the site of the present Turner gallery (room No. VI.) and the offices below it. In view of these alterations the large oil-paintings by Turner have been removed from room No. VI. (where, owing to the inadequate size of the skylight, they were never seen satisfactorily) to room No. I., which is far better adapted for the purpose. Of the modern British school pictures hitherto hung in room No. I., the larger ones have been rehung in rooms Nos. II. and III., while those of cabinet size have been temporarily removed into rooms on the ground floor, which, though not built for the exhibition of pictures, are tolerably well lighted and accessible to the public.

Among the foreign pictures *The Jewish Rabbi*, by Rembrandt, has been most often copied. The works which have been next in favour are—*Girl with Apple*, *Head of a Girl*, and *Young Girl Carrying a Lamb*, by Greuze; *Madonna in Prayer*, by Sassoferrato; *Spanish Peasant Boy*, by Murillo; *Ecce Homo* and *Youthful Christ and St. John*, by Guido Reni; and *Ruined Castle*, by Rembrandt. Romney's *Lady Hamilton* is the favourite English picture. The next in succession are Reynolds's *Age of Innocence*, *Heads of Angels*, and *Infant Samuel*; Landseer's *Spaniels* and *Dignity and Impudence*. A considerable number of examples of the British school have been lent under the National Gallery Loan Act to provincial institutions, the list of towns and cities that share in this generosity including Plymouth, Bradford, and Coventry. In all 125 pictures, including several of Turner's, have been sent out to home and provincial galleries, fifteen portraits to the National Portrait Gallery at South Kensington, nine miscellaneous examples to the National Gallery of Ireland, twelve to the Walker Art Gallery of Liverpool, eleven to Manchester, and similar numbers to the corporations of Nottingham, Oldham, Leicester, Stockport, Warrington, Stoke-upon-Trent, Sheffield, Dundee, and Glasgow.

**A Church** is proposed to be built to meet the increased requirements of the populous district of Gillingham, Rochester.

## GLASGOW UNIVERSITY BUILDINGS.

**A** LETTER, which has been addressed by Professor Dickson, of Glasgow University, to Sir Lyon Playfair, on the subject of the Universities (Scotland) Bill now before Parliament, suggests the difficulty of dealing on equitable terms in providing for the conservation of the various university buildings. The Professor says:—

1. The buildings of this university have been erected at the cost of (a) 117,000*l.* obtained from the sale of the Old College site and buildings; (b) 200,000*l.* contributed by the citizens of Glasgow and others (including Lord Bute's great gift); and (c) 120,000*l.* granted by Parliament. It might have been expected, even on the narrowest view of the matter, that the State, which had invested so considerable a sum as 120,000*l.* in the buildings, would, in its own interest, contribute something towards securing their maintenance; and still more that the officials of the State, which had received so noble a gift, would show some slight sense of public gratitude by helping to preserve it. The Commissioners of 1858 and 1876 recommended that the whole charge of the maintenance of the buildings should be undertaken, as regards all the universities, by the Board of Works, on the obvious grounds that the matter is one of public concern, and that it could be most effectively undertaken by those specially conversant with such work. Failing this course, the Commission of 1876 urged that the University of Glasgow should receive an annual grant for the purpose.

2. When on these grounds a formal claim was made on behalf of this university to be at least placed on the same footing as Edinburgh, first in 1876 and then in 1881, it was refused; and the reasons assigned for the refusal were peculiar and remarkable. It was argued that the university, having promised not to claim any further building grant, should hold itself precluded from asking for the same treatment as regards maintenance which the other universities had long received. It was suggested that the State, having given so largely to rear the fabric, should not be expected to take part in upholding it: and that just because the public spirit of the citizens of Glasgow had led them to do so much, it should be importuned to do more. In answer to the argument that the Board of Works had maintained the buildings of the Universities of Aberdeen and St. Andrews, it was suggested that these universities were comparatively small, as if it were a question of size and not of principle, and that "little had been expended on providing them with buildings," as if the expenditure on maintenance should be in the inverse ratio of the original outlay. Whatever may have been the case at Aberdeen and St. Andrews, the new buildings of the United College were provided for entirely by Parliamentary grant. A reference to the case of Edinburgh betrayed a strange misconception of the facts. The grant of 80,000*l.* recently given for the erection of the buildings of the medical department of the University of Edinburgh was set over against the grant of 120,000*l.* for the general building fund here, and it was argued that the University of Glasgow had thus received 40,000*l.* more than Edinburgh. But, apart from the consideration that money given for building could not without breach of faith with the Treasury have been capitalised and applied for maintenance, their lordships either did not know, or chose to ignore, the fact that the main buildings of the University of Edinburgh were erected at the public expense by a succession of grants in the earlier part of the century; that, besides a previous royal grant of 5,000*l.*, the sum of 120,000*l.* was given to Edinburgh by Parliamentary grant between 1815 and 1827, with a supplementary grant in 1831 of 6,000*l.*, making in all 131,000*l.*; and that in reality the latter university has received 211,000*l.* of public money for its buildings instead of 80,000*l.* To this falls to be added the 500*l.* of annual payment to Edinburgh since 1868.

3. Still more unfortunate was their lordships' reference to the state of the general university fund as warranting their refusal to admit a claim for Glasgow which had been long conceded to Edinburgh. Apart altogether from the fact, of which they take no notice, that the amount of the annual Parliamentary vote to Edinburgh (excluding that for maintenance) is 6,104*l.*, while that to Glasgow is only 3,465*l.*, being less even than is given to Aberdeen, the matriculation fees in 1882-83 were, in Edinburgh 3,208*l.*, in Glasgow 2,212*l.*; the graduation fees in the former (mainly derived from medical degrees) were 5,541*l.*, in Glasgow 2,972*l.*; while the amount of interest derivable from capital funds destined to the general university fund in Edinburgh was 1,181*l.*, while in Glasgow it was only 240*l.* To the answer of the University Court, in which their lordships had these arguments fairly put before them, they made no reply beyond a repetition of their refusal. *Stat pro ratione voluntas.*

4. Of course, as trustees, we make some attempt to keep up the buildings. Last year 753*l.* was spent on repairs; but, in order to meet this primary charge, we have to forego or keep down to the lowest level expenditure for other university objects and educational appliances. It may suffice to compare

a couple of heads in Glasgow with the corresponding heads in Edinburgh. The expenses of the Court and Senate in 1882-83 were in Glasgow 371*l.*, in Edinburgh 1,046*l.*; for class assistants and class expenses, over and above those sanctioned by ordinance, the amount in Glasgow was 76*l.*, against a sum in Edinburgh of 1,381*l.*

The simple effect of the bill as it stands is to leave this university charged with the whole of a burden from which the other universities are entirely or in great part relieved; not only to withhold from it what others get, but to compel it to divert towards maintenance of the fabric what the others are free to apply to current educational needs; and so to place it under a permanent disability, as regards means of carrying forward its proper work, of 500*l.* or 700*l.* a year. The very least that should be done in common fairness is to place Glasgow on an equality in this respect with Edinburgh; but the right course would obviously be to give at the rate of the average spent on the others for the last five years.

### JERRY BUILDING IN NEW YORK.

AT a little after 3 P.M. on Monday, April 13, says the *Sanitary Engineer*, a row of eight five-storey houses, situated at the south side of Sixty-second Street, between Tenth and Eleventh Avenues, in New York, and which were nearing completion, fell without a moment's warning, carrying with them a number of workmen estimated to be about forty. These houses were to be of the class that comes between the common tenement-house and the better grade of apartment-house, and were intended for two families on all floors above the first, with stone fronts to the first storey. The ruin was complete—not a cubic foot of masonry above the level of the basement walls being left standing, the appearance of the place reminding one of the havoc of a tornado. The most easterly building is supposed to have given away first, falling outward, the others tumbling consecutively in the same direction as the party-walls fell over, letting the whole into the cellars in an almost inconceivably broken-up mass. Faulty construction and cheap materials used in a rascally manner are without doubt the causes of the disaster. The bricks as they lay, though only a few hours after falling, are sufficiently free from mortar to be at once picked up and relaid; nothing adheres to them. A handful of the stuff with which they were laid can be crumbled to powder by the pressure of the thumb and forefinger.

The basement walls were laid up with the same mud, apparently, that was used in the upper part of the buildings, and the shaly rock, which was removed from the excavations in the neighbourhood in flakes no bigger than the hand, formed the greater portion of these walls. This rock we have a sample of in our office that admits of splitting with the fingers, and small pieces of it can be reduced to powder by the fingers almost as easily as can the so-called mortar.

On Sixty-first Street in the same block, and also at the end of the block facing the Eleventh Avenue, are more buildings apparently of this class, as yet unoccupied, that should at once receive the attention of the Building Department. The buildings on Sixty-first Street are out of plumb, and cracked, the iron columns under the lintel which sustains the front being out of plumb fully one inch in a length of eight feet, the whole end of the houses seeming to have a disposition to settle in the same direction. The wall of the house on the north-east corner of Sixty-first Street and Eleventh Avenue is distorted and bent so as to be hollow four or five inches, and the top corner of the same wall is so far out of plumb as to make it appear to a practical eye that should a line be dropped from the edge of the cornice it would touch the water-table.

### NEW BUILDINGS.

**Redditch.**—The foundation-stones of a new Temperance Hall at Redditch have been laid. The hall will comprise retiring-rooms, cloak-rooms, kitchen, store-rooms, and other out-offices. The buildings will be substantially constructed, with red brick walls, and a solid wood-block floor will be laid for the hall, the roof of which is to be open framed trussed rafters, with match-boarding on the under side, stained and varnished, and forming a coved ceiling. The roofs will be covered with slates, and red ridge-cresting is provided. The front will be a gable, rising to a height of 37 feet, finished with pilasters, panels, moulded brick strings, cornices, ornamental stepped copings, and pediment. The pediment will have an ornamental panel with date, also an inscription stone, "Temperance Hall." A large semicircular window will be placed in this front, and there will also be large double entrance doors, with fanlight over. There are also four three-light windows provided on either side of the hall. A lean-to porch will be fixed over the front main entrance doors, and will be covered

with ornamental tiles. The general design of the building partakes of a Queen Anne character. The hall will be a well-proportioned room, about 70 feet long by 34 feet wide, 13 feet to wall-plate, and 25 feet high to apex of the ceiling. A platform, raised 3 feet 6 inches, will be placed at the northern end of the hall, communicating on either side and on same level with retiring and committee rooms, which have open roofs and are ceiled to underside rafters. There is a front main entrance and two side entrances, all the doors of which open outside to avoid danger in case of panic. The contract, amounting to 860*l.*, is being carried out by Messrs. C. G. Huins & Sons, of Redditch. The building has been designed by and will be carried out under the supervision of Mr. Ernest Day, architect, of Worcester.

### CHURCH BUILDING AND RESTORATION.

**Bulwell.**—A church erected at Quarry Road, Bulwell, has been opened. It is built of Bulwell stone, with Bath stone dressings, and consists of nave, north and south aisles, chancel, vestry, and organ-chamber. The church is seated for 600, and was built by Mr. McCulloch, of Bulwell, from designs by Mr. W. Knight, architect, of Nottingham.

**Kinnerton.**—The church of St. Mary, Kinnerton, in the parish of Old Radnor, has been completely rebuilt, at a cost of 1,500*l.*, and reopened. The church is in the Early English style, and consists of a chancel, nave, organ chamber, vestry, and porch. The walls are of local stone, with internal dressings of Bath and Bromsgrove, and external dressings of Bromsgrove stone. The architect is Mr. T. Nicholson, of Hereford (diocesan architect), and the contractor, Mr. Thomas Collins, of Tewkesbury.

### GENERAL.

**A Picture by Henshaw** has been given to the Birmingham Art Gallery by the daughters of the late Mr. Timothy Kenrick.

**The Picture of "Marat dans sa Baignoire,"** now exhibiting at the Paris Ecole des Beaux-Arts, is declared by the grandson of the painter David to be only a copy. The original, that which hung in the hall of the Convention, he claims to have in his possession.

**The Shakespeare Memorial Window** placed in Stratford-on-Avon parish church by American subscribers was unveiled on Tuesday.

**The Earl of Dartmouth**, on Saturday afternoon, opened the new public swimming baths at Dartmouth Road, Forest Hill, erected by the Baths Commissioners at a cost of 9,000*l.*

**Mr. Sydney Mitchell**, architect, has been commissioned to design the proposed restoration of "The Mercat Cross," Edinburgh.

**The Fund** for restoring the ancient church of St. Bartholomew, in Smithfield, has now reached the sum of 5,000*l.*

**The Bank of England**, it is stated, has purchased for 30,050*l.* the site of the Cock Tavern and the vacant land in Fleet Street between Chancery Lane and the Law Courts, for the erection of new buildings for the accommodation of the large business in connection with the Courts of Justice.

**The Earl of Feversham** has given a site for the erection of a church at Carlton, in the parish of Helmsley, Yorkshire. The structure is to be in the Early English style of architecture, from plans by Mr. Temple Moore, of London.

**The Profits** accruing from the Walsall Corporation Gas-works show a falling off during the past year, and consequently a borough rate, the first for several years, has been imposed.

**Official Accounts** just published of the International Forestry Exhibition, held last year in Edinburgh, show that the total income was 22,957*l.* 9*s.* 8*d.*, and the expenditure 22,665*l.* 1*s.* 8*d.*, leaving a balance of 291*l.* 14*s.*

**Additions and Alterations** to the Railway Servants' Orphanage Buildings, Ashbourne Road, Derby, are to be carried out at a total cost, including heating, cooking, and washing apparatus, of 8,000*l.*

**The Manx Legislature** on Tuesday sanctioned the expenditure of 62,000*l.* on works of harbour improvement at the various insular ports, namely, Douglas—extension of the Queen Victoria Pier by 300 feet, 45,000*l.* Peel—completion of the outer works, as already sanctioned, 2,000*l.*; extension of the break-water, 5,000*l.* Port St. Mary—completion of the pier, as already sanctioned, and extension of the work, 5,300*l.* Castletown—construction of a bridge and works, 4,760*l.*

**"The Canterbury Pilgrims."**—The plate of the *Flych of Bacon* has caused so many additional inquiries to be made for the companion, the *Canterbury Pilgrims*, that we have been induced to arrange for the republication of that plate. It has been long out of print.

## LAND IMPROVEMENT WORKS.

The report of the Land Commissioners for England shows that the expenditure up to the end of last year on land improvement in Great Britain under the various Land Improvement Acts, and charged upon estates by rent-charges for limited terms of years, amounted to 14,629,795l. 11s. 3d. Four millions of this was public money advanced by the Exchequer under the Public Money Drainage Acts for the drainage of agricultural land, nearly all of which has now been repaid by the landowners. The remainder has been found through the several land improvement companies and by landowners themselves. The two principal items of expenditure under this head are—

drainage, 8,634,157l. 12s. 11d., and farm buildings, 3,823,019l. 7s. 2d. Under the Land Drainage Act of 1861, the object of which was to promote land drainage by enabling the landowners of a district to carry out a concerted system of main drainage and general outfalls, twelve Commissions of Sewers have been issued for the drainage of 28,811 acres, and twenty-six elective drainage districts have been constituted containing 62,742 acres. Under the powers given the Commissioners, by two special Acts, the Thames Valley Drainage Act and the Somersetshire Drainage Act, many thousands of acres in the upper valley of the Thames and in the Bridgwater level are being placed under a concerted system of drainage. The number of inspections made during the year was 2,450, and 2,113 extracts were supplied at a total cost to the applicants of 2,649l. 17s. 10d.; 4,254 maps have been altogether supplied, 121 of which were prepared during the year.

## SANITARY PRACTICE IN CANADA.

At the meeting of the Scottish Society of Arts, Edinburgh, Mr. W. Allan Carter, C.E., communicated a paper on “Canadian Sanitary Practice” by Mr. Alan Macdougall. The paper explained that the Canadian practice differed from that in this country principally in respect that the soil-pipes were taken up in the interior of the houses instead of on the outside. This was rendered necessary by the fact that during the severe winters experienced in Canada the soil-pipes would freeze up in a single night, and would then be useless for the rest of the winter. In regard to the water supply, a great quantity of water was used—on an average more than 100 gallons per head per day. This was due to the wholesale waste which had been allowed to take place, and which the authorities were now trying to check.

## TORONTO PUBLIC WORK.

THE City Engineer of Toronto, Canada, in his report, states that in 1884, 575,689-31 dols. was expended for public work in that city. Of this about 275,000 dols. was expended on roadways, 131,236 dols. on sewers, and 126,000 dols. for general street purposes. There are now 107-25 miles of sewers in the city, and 164 miles of streets. During the year 8-42 miles of cedar-block pavement were built. The cedar block already laid is showing signs of rapid wear, and the engineer recommends a more durable material on the main traffic streets. One hundred and thirty miles of streets have been paved since 1881, and of this 33-86 miles are laid with cedar block.

## TRADE NOTES.

A TWO-LIGHT Munich stained-glass window has just been erected in the parish church of Newchurch, Rossendale. The subjects represented are *St. Elizabeth teaching St. John and Giving Alms*. The work has been designed and executed by Messrs. Mayer & Co.

In a climate so changeable as ours a certain means of drying paint without injuring it is very important. This is one of the specialities to which Messrs. Randall Bros., of London, have always given their attention. Their French powdered dryers, liquid dryers, both pale and dark, are all valuable agents which the painter and decorator should keep in stock.

MESSRS. JONES & WILLIS have supplied the choir stalls in oak, and the handsomely-carved bishop's chair, for the Lea Memorial Church at Birmingham, which has been erected from the designs of Mr. J. A. Chatwin, architect, of Birmingham.

MESSRS. VENTOM, BULL & COOPER, of 35 Old Jewry, E.C., on Monday sold by auction the first portion of the Waterloo Estate, Edgwaite Road, Kilburn. The sale resulted in one of the most complete successes known in the district. Nearly all the plots were sold, the aggregate amounting to about 17,000l. The second portion sale will be held in about a month's time. The portion put up for sale on Monday comprised 111 lots of valuable freehold building plots, suitable for the erection of shops and houses, the principal frontage to the estate being on the Edgware Road, and thus commanding special facilities by omnibus or railway routes.

## COMPETITIONS OPEN.

WHITCHURCH.—May 9.—Designs are requested for a Small Cottage Hospital. Major Lee, Whitchurch.

## CONTRACTS OPEN.

ABERDEEN.—May 13.—For Building Farm Dwelling-house. Messrs. Anderson & Rae, 14 Union Terrace, Aberdeen.

ACTON.—May 15.—For Building Two Houses, Enfield Road. Mr. C. Nicholson Lailey, Surveyor, Ellesmere, Uxbridge Road, Acton, W.

ALCESTER.—May 11.—For Building Sanatorium or Hospital, with Administrative Buildings. Messrs. Harris, Martin & Harris, Architects, 119 Colmore Row, Birmingham.

ALNWICK.—May 23.—For Building Bridge over Tyelaw Burn. Mr. C. Percy, Clerk to the Highway Board, Alnwick.

ALVES.—May 12.—For Additions and Repairs to Farm Steading, Earnside. Messrs. A. & W. Reid, Architects, Elgin.

BACUP.—For Building Brick Chimney. Messrs. Butterworth & Brook, Britannia Quarries, near Bacup.

**HOLBECK.**—For Building Eight Houses, &c. Mr. C. F. Wilkinson, Architect, 8 Infirmary Street, Leeds.

**HORWICH.**—May 11.—For Building Shops for Locomotive Engines. Plans at the Engineer's Office, Hunt's Bank, Manchester.

**KEIGHLEY.**—May 11.—For Building Residence, Highfield Lane. Mr. W. H. Sugden, Architect, 25 Victoria Terrace, Keighley.

# R. ADAMS,

17 BLACKMAN STREET & 7 GREAT DOVER STREET, LONDON, S.E.,  
INVENTOR and PATENTEE of the  
SAFETY WINDOW WITH REVERSIBLE SASHES

FOR

INEXPENSIVE & PERPETUAL CLEANLINESS

Which has gained at the INTERNATIONAL HEALTH and  
SANITARY EXHIBITIONS

2 Gold, 4 Silver, and 4 Bronze Medals,  
and 16 Diplomas of Merit.

The fearful sacrifice yearly of Life and Limb of persons in cleaning windows through sitting or standing outside whilst so engaged is most appalling. This can now be entirely prevented. The Patentee, having given this subject the most exhaustive study, is now prepared to supply his patent fittings suitable both for old and new windows at prices to meet the means of all. These improvements are protected by several patents, by each of which the outside of each sash can be reversed for cleaning, and under this new system that duty is rendered a pleasure, whilst the danger, risk, and tremendous responsibility of moral and statute law is removed.

These patent fittings can be procured from 5s. for each sash, and all builders have the right conferred upon them to fit the same in the purchase thereof, and that all shall have the benefit of this national boon, special Agencies are being established throughout the United Kingdom. None but practical and responsible firms are appointed. Such firms are invited to apply for unrepresented districts at once, as it is desirable to complete the list as soon as possible.

The present representatives are:—

Patentees:—**W. E. RENDLE & CO.,**  
3 WESTMINSTER CHAMBERS, VICTORIA STREET, LONDON.

TO  
ARCHITECTS, BUILDERS,  
AND  
CONTRACTORS.

## STEEL CUT NAILS!!

The modern and important discovery in the process of making Steel has so reduced the price, that Steel Cut Nails of the well-known "Mitre Brand" can now be supplied at only 12. 6d. per cwt. more than the price of the ordinary Common Iron Cut Nails.

The Steel Cut Nails are far superior in quality and more uniform in size than any wrought or hand-made Nails yet produced, and being lighter in weight than ordinary Iron Cut Nails and free from wasters, they are found cheaper in actual use than common Iron Cut Nails at 1s. 6d. per cwt. less.

These Steel Cut Nails are specially suited for Builders, Joiners, Coopers, Packing-Case Makers, &c., and a single trial is sufficient to convince any one of their superior quality and cheapness.

## PATENT WROUGHT STEEL NAILS. OVAL WIRE NAILS.

of Woods & Forests, Royal Engineers, &c.  
All Instruments guaranteed. Quality, accuracy, and prices  
unsurpassed. Original Manufacturers of Vulcanic Scales, Pro-  
tractors, Curves, Angles, &c. General Catalogue, No. 1, 166  
Illustrations, 62 pages, three stamps. Stencil Plate Catalogue  
No. 3, 200 Illustrations, three stamps. Established 1795.

**G. & T. EARLE,**  
HULL.

MANUFACTURERS OF LIGHT, DARK AND PORTLAND CEMENTS,  
LIAS LIME AND MASTIC,  
PLASTER PARIAN, KEEN'S PAIS WHITE, HAIR LATHS, ETC.

EARLE'S PORTLAND CEMENT is the best adopted for  
stucco work, and for use in sewage works and the construction of  
Gas Holder Tanks.

EARLE'S LIGHT ROMAN CEMENT sets very rapidly, and  
is specially useful in cases where the sea or a tidal river has to be  
outended with.

AS SUPPLIED TO 600 PUBLIC HEALTH BODIES.

The Sanitas Co., Limited, Bethnal Green, E

## GRUNDY'S PATENT WARM-AIR VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.

#### TESTIMONIALS.

"9 Victoria Chambers, Westminster, S.W.

"SIR,—I have much pleasure in testifying to the efficiency of your patent Warm-Air Fire Grate. It has been very successful, and given every satisfaction where I have used it.  
Yours, &c.  
JAMES WEIR, F.R.I.B.A."

"To Mr. Grundy.  
"Baptist Chapel, Clapham Common, London. Richard Webb, Pastor, 10 Grafton Square.  
February 15, 1884.

"DEAR MR. GRUNDY,—I have pleasure in testifying to the excellency and efficiency of your patent Fire-Grate. It is the most charming invention for heating a large room I have ever known. I shall have pleasure in showing it to anyone who wish to have their schools or rooms pleasantly and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool, July 1884.

"DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West-Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public.  
"Mr. John Grundy."  
From Hon. and Rev. G. G. C. Talbot, M.A., Withington, Cheltenham.

"DEAR SIR,—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen.  
"Mr. John Grundy."

From F. J. Yates, Esq., Architect, Birmingham.  
"The best of the kind I have seen. I shall have pleasure in securing their adoption whenever opportunity offers."

Apply to JOHN GRUNDY, 30 Duncan Terrace, City Road, London.  
Works—TYLDESLEY, near MANCHESTER.

THE GREAT PROBLEM OF THE XIX<sup>TH</sup> CENTURY.VENTILATION  
WITHOUT DRAUGHT.

The hitherto unsolved problem of "Ventilation Without Draught" is to be seen practically illustrated at FREDERICK HENRY SMITH'S Test Room, No. 68, 52 Queen Victoria Street, E.C., Patentee of the Automatic Siphonic Aspirator System of Ventilation. A personal inspection invited.

*Extract from the Annual Report of the "French Hospital and Dispensary," issued 29th January, 1885.*

We have also to return our best thanks to Mr. Smith, who undertook gratuitously to repaint one of our wards and to apply a new system of ventilation of his own invention, which was very successful.

*Letter from David Urquhart, Assistant Engineer to Colonel Sir Francis Bolton, C.E.*

F. H. SMITH, ESQ., 52 QUEEN VICTORIA STREET, E.C.

4 THE SANCTUARY, S.W., LONDON: NOVEMBER 22nd, 1884.

In reply to your inquiry, I have much pleasure in certifying that your system of ventilation as applied to the "Island Room" of the Illuminated fountains at the Health Exhibition reduced the temperature during the displays from about 110 deg. to about 70 deg., and thus enabled the men to perform their duties without inconvenience.—Yours faithfully,

DAVID URQUHART.

*Extract from the TIMES of March 14, 1885, page 7.*

"VENTILATION WITHOUT DRAUGHT.—This desideratum appears to be accomplished by a syphonic system devised by Mr. Frederick H. Smith, at whose offices, 52 Queen Victoria Street, London, we recently inspected the arrangement. The air supply is conducted into the apartment from the external atmosphere by means of air ducts, which terminate in distributing passages at the floor level. The exit for the vitiated air is placed in the ceiling, and consists of two tubes, a large and a small one, running parallel to each other between the floor joists in the case of rooms having others over them. In the case of rooms on top floors, or those having the roof directly over the ceiling, the tubes are placed concentrically, but the action and results are the same. The larger of the two tubes carries off the vitiated air, while the smaller one forms an induction tube for cold air, its outer extremity being open to the atmosphere. These two tubes or conduits are so connected that the passage of the heated air through the larger tube induces a current of cold air through the smaller one in a continuous stream. The result is a rapid clearing away of all deleterious gases and products of combustion as they accumulate, and the preservation of a pure atmosphere at an equable temperature in the apartment. In a small room at Mr Smith's offices in which five large gas-jets were burning, the atmosphere was apparently quite innocuous at the level of about 7 feet, the temperature being about 60 deg. Fahr. At a higher level, however, and especially near to the ceiling, the temperature was high and the air greatly vitiated. It was demonstrated that this vitiated air was being drawn off through the exit tube, which acted as a powerful sucker. After turning on one gas-burners, and upon the temperature of the room generally becoming lowered and equalised, a feeble upward action was still maintained in the upcast tube, but there was no down-draught whatever. The system has already been applied to a church and other buildings with acknowledged success."

# DAMP WALLS.

**BLUNDELL'S PETRIFYING LIQUID**  
 Is a preparation for interior use, for the cure of **DAMP WALLS**. It is made in two colours, White and Red. It is applied with a brush as easily as ordinary paint, and dries hard in a few hours with a glazed surface. The many uses of such an article are obvious. As an economical substitute for White and Red Glazed Bricks, for interior walls, it is most efficient. Applied over brick, cement, iron, or wood, for the walls of passages, kitchens, schoolrooms, hospitals, and charitable institutions, where **CLEANLINESS** is indispensable, it will be found invaluable, as the smooth enamelled surface offers but little hold for dirt, &c., and can be washed when necessary. Used over walls before papering, it prevents discolouration, and offers a surface to which the paper will adhere firmly. Economical in cost, simple in application, and efficient in use. The proprietors recommend it with full confidence. To be obtained of the leading Paint, Colour, and Varnish Dealers.

**BLUNDELL, SPENCE & COMPANY, LIMITED,**  
 Colour, Paint, and Varnish Makers, Oil Boilers and Refiners,  
 HULL, and ANCHOR WHARF, 9 UPPER THAMES STREET, LONDON, E.C.

**VOLUME XXXII. OF THE ARCHITECT.**

Handsomely bound in Cloth, Gilt Lettered. Price 12s. 6d.—Office: 175 Strand, London, W.C.

**MISTAKES IN PLUMBING.**

A LECTURE under the above title was lately given at the New York Trades School. The following heads give a general outline of mistakes most commonly made.

1. Not to carefully determine what the grade of a sewer shall be before commencing to lay the pipes.
2. Putting the pipes into a tight hole in the front wall where it enters the cellar.
3. Using T connections for branches for soil and waste pipes.
4. Tipping up traps so as to cause them to lose their seal.
5. Using larger traps than are necessary.
6. Connecting wastes from safes with soil or waste pipes.
7. Putting in a trap at foot of soil pipe.
8. Connecting sanitary flushing closets without making proper provision for the ventilation of the traps or branches.
9. Running a vent pipe in such a manner

as to form traps, or where the overflow can enter.

10. Running the ventilating pipes into chimneys or ventilating flues.
11. Placing traps at too great a distance from the fixtures for which they are intended.
12. The use, where it can be avoided, of pan-closets.
13. Connecting overflow of tanks directly with soil or waste-pipes.
14. Having waterclosets in rooms or opening into rooms where storage tanks are used.
15. Breaking joints in iron pipe, and not using proper fittings for change of direction; also using pieces of pipe as substitutes for sleeves or hubs.
16. Neglecting to trap leaders.
17. Connecting branch wastes with water-closet trap, particularly when separately trapped and vented.
18. Trapping connection for hot water from side coupling for boiler with water-back.
19. In not enlarging hot-water pipe to desired size, and in making wrong connection between the water-back and range.
20. Running "circulation" pipe so as to form a trap or traps thereon.
21. Connecting the inside and outside of a double boiler with one connection to the water-back of the range.
22. Connecting the sediment-pipe of double boiler in such a manner as to render it possible to empty the inside before the outside boiler.
23. Neglecting to put in expansion-pipes or vacuum-valves where valve couplings are used on boilers.
24. Running the water-pipes without sufficient grade to empty them.
25. Putting up hot-water pipes without allowing for expansion, and having straight branches from hot-water pipes.
26. Using lead pipes for hot water where hot water is heated from a steam-supplied tank.
27. Using lead for lining tanks for storage for domestic purposes.
28. Using impure lead, such as old joints, &c., for calking joints.
29. Putting supply and waste pipes in in-

accessible and undesirable locations where they are liable to freeze, and not sufficiently protecting them.

30. Connecting directly on supply pipe the valves of waterclosets.
31. Allowing raspings and filings to fall into pipes.
32. Taking keys out of ground key-cocks for the purpose of wiping them in.
33. Supplying bath-tubs from the bottom, thereby endangering the fouling of supply-pipes on lower storeys by siphonage.
34. Putting in mains in a street without allowing for settlement and without properly blocking up under the tap.
35. Using pipe-hooks instead of metal racks and screws for supporting pipes in recesses or along ceilings.
36. Making joints with soldering-iron in place of wiping where required.
37. Using tin-lined pipe for hot water.
38. Not using a boiler of a size proportioned to that of the range; also using ranges with small water-backs.
39. Omitting to close terminations of soil and waste-pipes; also the ends of croton or supply-pipes which are likely to be obstructed.

**CLERKS OF WORKS ASSOCIATION.**

A LARGELY attended monthly meeting of the members of the above association was held on the 4th inst. The president, Mr. E. Moore, in his address made the following remarks:—We have now entered upon the fourth year of our existence, and have shaken off, so to speak, the swaddling-clothes of infancy. We have arrived at that period in which it behoves us to take steps forward with courage not unmixed with caution and prudence, or, as our American cousins put it, first be sure you're right, then go ahead, our constant aim and watchword being proficiency and progress. Speaking for myself, I confess that I look back on the past year with almost unmixed pleasure. There has been a steady increase of members, which we have reason to hope will continue. Our journal

also has done, and I trust will do, great things towards bringing the association prominently to the notice of all leading architects and surveyors. Again, the isolated position formerly occupied by the clerk of works has become a thing of the past. Instead of being scattered, and comparatively unknown to each other, we are, by means of this association, drawn and linked together by ties of fellowship and good feeling, and as years roll on we shall, as we watch its progress, esteem and love this institution increasingly. A certain result of a body of men united in one common calling, whose aims and aspirations are essentially alike, must be social intercourse, mutual professional assistance and benefit individually, and the progress of the association generally. Having sketched a few of the benefits already conferred upon us by this association, let us pause to consider one other point in connection with which it appears to me that our success has not been quite so gratifying as I could wish. I distinctly remember when the rules of this association were being drawn up, that our chief object was so to frame them as to insure that every member enrolled should be a *bonâ fide* and thoroughly competent clerk of works. It was ably argued, and to my mind conclusively shown, by gentlemen then present, that by adopting this course we should at once start the association on a sound basis, and as a result not fail to secure the co-operation and assistance of architects generally. Our sanguine expectations in this direction have not up to the present been so fully realised as I could wish. We certainly have occasionally received good wishes and encouraging remarks and comments from some eminent architects, which have had their due effect in stimulating us to greater exertions. We have also received applications for the services of clerks of works from some few architects, which were promptly and satisfactorily responded to. But these must be not merely more frequent, but, to satisfy me, they must be continuous. The association must eventually be the one source from which architects seek their practical superintendents of works. Architects and professional men generally must be made to under-

stand that this institution undertakes the fulfilment of their constant and most important and pressing requirements. Their attention must be constantly drawn to the fact that the members of this association consider the interests of architects to be identical with their own. Seeing that it exists for the purpose of increasing the practical as well as the theoretical knowledge of its members, how could it be otherwise? Why, then, have we not yet fully realised our hopes in this direction? It strikes me that the answer must be that we have perhaps been a little too apathetic upon this matter, very zealous in social intercourse amongst ourselves, anxious certainly in all directions to increase our stock of knowledge, and perhaps our zeal in this direction has caused us for the moment to lose sight of the fact that we are in a great measure leaving architects to themselves. Do architects as a rule yet realise the fact that this association consists of the most experienced men of their class, who meet together for the purpose of acquiring additional professional knowledge and intellectual improvement by the reading of technical papers and general discussions thereon, and that the benefits derived therefrom must of necessity be shared more or less by them? Let them but become fully acquainted with this fact, and surely it must follow that our connection with them will soon be largely increased. Any address from this chair would be incomplete if it omitted to mention the debt of gratitude we owe to Mr. John Oldrid Scott for his liberality and many kindnesses bestowed upon us from the first. Particularly must be mentioned his gift of the free use of this office for our business purposes, which to us has been truly a gift of very great importance. I consider also that his kindness and patronage have in no small way contributed to our attaining our present position, and I am sure I only echo the sentiments of every member of this association when I say that his name will ever be remembered by us all with lasting esteem and gratitude. In conclusion, I will only add, let us each continue our best endeavours to further the interests of the

association by every legitimate and honourable means. It would not, I think, be asking too much from such a body of men as ourselves that a paper should be read at each of our monthly meetings, not necessarily long, but certainly a practical one. This, I think, would be one step in the right direction. Let all our discussions be free from discord, perfect harmony prevailing in our united efforts to bring the association into its future prominent position; and when the time arrives for me to relinquish the duties that now devolve upon me, I trust that in passing them into other and abler hands I shall be in a position to say that the year during which it has been my privilege to occupy this chair has witnessed a larger share of success than has hitherto been attained, especially in the direction which I have more particularly dwelt upon.

### IS A COURTYARD A SPACE?

ON Saturday Messrs. Mowlem & Co., the contractors, were summoned before Mr. d'Eyncourt by the Metropolitan Board of Works for various offences under the Metropolis Management and Building Acts, such as forming or laying out a road, passage, or way leading out of the King's Road, Chelsea, as a street for the purpose of foot traffic only, and so as not to afford direct communication between two streets; building "as a street" for foot traffic only, without the sanction of the Metropolitan Board of Works; building a street for foot traffic of less width than 20 feet, and constructing it without being open at both ends from the ground upwards. The whole of the works are in connection with a block of dwellings for the industrial classes. At the back of the premises is an open yard, about 60 feet wide and 75 feet long, and this is approached from the main road by an archway 12 feet 6 inches wide and 10 feet high, of sufficient dimensions to allow of the passage of a carriage or coal wagon. The passage-way was stated to be 27 feet long. On the north side of the yard is a block of six dwellings; on the east and west sides are small two-storey houses,

# THE "HARDING" VENTILATING COMPANY,

30 EAST PARADE, LEEDS.

## HARDINGS' PATENT AIR DIFFUSER

FOR VENTILATING ALL KINDS OF BUILDINGS.

Diffuser with Filter.

Mr. T. PRIDGIN TEALE, F.R.C.S., M.A., Surgeon to the General Infirmary at Leeds, says of Hardings' Diffuser in his book called "Dangers to Health":—"I am satisfied that by means of this apparatus, we can secure in a town freshness of atmosphere, absence of draught, and exclusion of dirt."

The fresh air is conducted through a grate and aperture in the wall, as shown on section, about 7 feet 6 inches above the floor level; it is then conveyed through the filter, and passed into the room through a series of small tubes placed at an angle of about 30 deg. with the wall.

By these means the currents of air rushing into the apartment are compressed whilst passing through the tubes. The currents of air, as soon as liberated, expand, cut into, and break each other up, and diffuse in all directions so effectually that no draught or chilly sensation can possibly be experienced by the occupants, and at the same time a large volume of pure air is constantly being admitted and dispensed evenly through the apartments.

**CHURCH WALL VENTILATOR.**—As used in the ventilation of Archbishop Zouche's Chapel, York Minster.

The DEAN OF YORK, with reference to the ventilating of Archbishop Zouche's Chapel at York Minster, says:—"I think the ventilation is perfectly successful, and all I have spoken of about it are well satisfied with it, and much pleased with the result."

**OUR PATENT EXTRACTOR** is the best in the Market, and is supplied at a very much lower price than any other.

**CHURCH WINDOW VENTILATOR.**—These Ventilators are used for Churches, Chapels, and other Public Buildings where it is not desirable to have holes cut through the walls to admit air in the usual manner. The appearance is not more noticeable than the ordinary Hopper Ventilator so frequently seen.

"GENTLEMEN,—I have pleasure in stating that in my opinion your system of ventilation, introduced in our Church this summer, is a decided success. Heretofore when the Church has been well filled at the Evening Service, I have been almost exhausted by the effort of speaking before I have got half through. On Sunday night, October 7, at our Harvest Thanksgiving, we had a very large congregation, and I preached without the least feeling of weariness or exhaustion. I shall be glad to hear that your Air Diffusers are being widely adopted.—I am, yours truly, JOHN GREGORY, Minister of Oak Road Congregational Church, Leeds."

These Ventilators are more suitable for Schools, Warehouses, and other Buildings where cheapness is an object. The result is precisely the same as in our other styles, at a very much smaller cost.

A reduction in price is made where a number of Diffusers is required.

Estimates and further information given on application to the "HARDING VENTILATING CO., 30 East Parade, Leeds.

Air Extractor.

and foundations of outbuildings. All the dwellings are built to accommodate several families, and the upper storeys are approached by a gallery after the manner of the Peabody buildings. The backs open into the courtyard, and there is no other exit from the square except the passage-way into the King's Road. Application had been made to the Metropolitan Board to sanction the arrangements, but was subsequently withdrawn on the ground that it was not legally needed. Mr. Avory said the proceedings had been taken by the Board solely because in their public capacity they were unable to make exceptions in favour of individuals, however worthy their objects might be. Mr. d'Eyncourt asked how anyone could be prejudiced by such a construction as the defendants were making. Mr. Avory said the 7th section of the Act of 1882 gave the Metropolitan Board powers to prohibit the formation of a *cul de sac*. Another mischief to be guarded against was the obstruction of public traffic. It was here proposed to close the archway at night with a gate, and in case of fire there was likely to be danger; the engines might be stopped by the gate, which was locked at night. A very similar case to the one at issue had been decided in favour of the Board at Lambeth Police-court, and on appeal to the Quarter Sessions the decision was upheld. It was to be regretted that the case was not taken to the High Court, and the point definitely settled. Mr. d'Eyncourt suggested the case of Burlington House as analogous to the matter at issue. Mr. Avory thought every case should depend absolutely on its own merits. The word "street" throughout all the Acts had a very wide interpretation. There was nothing limiting it to be a public thoroughfare or highway. It included even a mews, and why should it not therefore include a place like that built by the defendants? No doubt the courtway was now in the hands of a company who would well look after it; but it might not always be in such good hands. Fourteen separate dwellings for one hundred and twenty people were to be erected, and the Metropolitan Board were bound to maintain their right of jurisdiction in the interest of the

public. Mr. Cripps for the defendants said they were not laying out a new street. It was originally a block known as Park Terrace Cottages, and now the site was simply utilised for better dwellings. The managers of the buildings considered that their privacy was of essential importance. If the place was a public street, and left open at night, the balconies, &c., would become the refuge of tramps and vagrants. The place was no more a public street than Furnival's Inn, Barnard's Inn, or Staples Inn. The first Metropolitan Local Management Act dealt especially with the regulation of buildings where there had been buildings before, and no power was given to the Metropolitan Board to interfere with existing property rights. His contention was that the Metropolis Management Act of 1882 merely had reference to questions of new streets. Here there was no intention to make a new street. Evidence was given that the buildings were to be managed on Miss Octavia Hill's system. A gate would be closed at night, all the tenants having keys, and the courtyard was to be laid out as a garden, with seats. Privacy was considered essential, although there would be nothing to prevent the public access to the courtyard in the daytime. Mr. d'Eyncourt reserved his judgment.

#### REPAIRS OF DRAINS.

THE decision given by the Court of Appeal in *Hugall v. M'Kean* on the 1st inst. is of importance to the owners of houses, as it confirms the necessity of special notice from tenants, before responsibility for defective drains devolves on landlords. The plaintiff is proprietor of a ladies' school at Blackheath, and in August 1882 agreed to take a house for three years from the defendant (a receiver under the Court of Chancery), who covenanted to keep the drains and sewers in good tenantable repair and condition during the tenancy. The defendant expended 50% in repairs in accordance with a term in the agreement. On June 18, 1883, the basement was suddenly flooded with sewage which forced

itself up the traps. The plaintiff immediately called in a sanitary engineer, who found the drains in a defective and dilapidated state. Among other defects a 4-inch pipe was connected without any cement with a 9-inch pipe, leading from a cesspool, and the sewage was oozing from the joints; also the soil-pipe passing through the house was corroded and leaking with sewage. It was alleged that the flooding was due to the pressure from the cesspool. The plaintiff, without notice to the defendant, immediately did the necessary repairs, and sought to recover the cost (50%) from the defendant. The defence was that the plaintiff should have given notice to the Court of Chancery of the want of repairs, and the Chief Clerk said he was unable to allow anything which was not legally due. It also appeared that the plaintiff paid the midsummer's rent without any complaint, and that no notice was given to the defendant until September. At the trial before Mr. Justice Wills, the jury found that the plaintiff did not know, and had not the means of knowing, that the drains were in a bad condition prior to June 18, 1883; that the defendant did not know, but had the means of knowing, that the drains were in a bad condition prior to that date. On those findings Mr. Justice Wills entered judgment for the defendant, whereupon the plaintiff appealed.

The Master of the Rolls, in dismissing the appeal, said that the terms of the covenant were substantially the same as those construed in "*Makin v. Watkinson*" (L. R. 6, Ex. 25). The effect of that decision was that into such a covenant there should be imported the condition that the landlord shall have notice of the want of repairs before he can be called on under the covenant to make it good. But the plaintiff could not say that the landlord had such notice. In the circumstances his lordship thought that the case was hard on the plaintiff; but it was not cruel, because the Court of Chancery had to consider the rights of the other persons interested in the administration action. Their lordships must abide by the law, and say that the judgment should be affirmed.

# "THE PEDESTAL VASE," JENNINGS' IMPROVED W.C. APPARATUS

(Combination Urinal and Slop Sink).

Registered No. 16,300.

A PORCELAIN VASE set on a tiled or mosaic floor, within walls or a dado of glazed tiles. The usual wood framing, forming a storehouse for the retention and accumulation of *damp*, *dirt*, and *disease germs*, with the joints, crevices, and imperfections in work which the closet enclosure so often conceals, is entirely abolished. The seat is hinged, permitting free access for use as a *slop sink* or *urinal*, and for cleansing, so that the entire apparatus and space can be freely washed down. For this latter purpose the floor should be slightly sunk, and laid to fall to a grating, with waste carried through the external wall, and terminating in a copper flap valve to prevent draught.

The suggestions as regards wall linings and floor, may, of course, be modified as best adapted to the building in which the closets are used; and in the consideration of such details, alternative schemes will readily present themselves.

At the recent **HEALTH EXHIBITION** (South Kensington, 1884), amongst a series of official tests, under the supervision of Baldwin Latham, Esq., C.E., and the Jury No. 9, Class XXIII., and successfully witnessed by this closet, the following may be cited in evidence of its efficient action. Being fixed in position shown in illustration, with **"JENNINGS' PATENT SINGLE FLUSH WASTE-PREVENTING SYPHON CISTERN"** 5 feet over, with  $1\frac{1}{4}$  inch down pipe, ten apples (averaging  $1\frac{1}{4}$  inch diameter) and a flat sponge about  $4\frac{1}{2}$  inch diameter were thrown into the basin. The water, as well as the whole of the exposed or dry surface, was first blackened with plumber's "smudge," and the sides covered by four pieces of thin sanitary paper, which adhered closely to the soiled surface. The handle of the cistern was then pulled, and the two-gallon flush liberated. After seven seconds (the time occupied by the discharge), a receiver placed under the trap outlet was removed, containing in the blackened water the ten apples, the sponge, and the four pieces of paper, no traces of the soil remaining visible upon any part of the apparatus.

**GOLD MEDAL AWARDED.**

THESE CLOSETS are already in use in Hospitals, Banks, Hotels, Offices, Private Residences, &c., with most satisfactory results, and, fixed in the manner described, in appearance and action leave nothing to be desired. By the novel arrangement of the supply to Basin, as shown in the sectional sketch annexed, the whole surface is well flushed and cleansed, whilst the bottom of Basin and Trap are thoroughly scoured by a concentrated rush of water which insures the **instantaneous removal** of the contents, thus overcoming the inherent defects in the many imitations recently produced of **"JENNINGS' MONKEY-CLOSET"** (the original form of wash-out watercloset), which was invented and patented by G. J. in 1852.

# The Architect.

## THE WEEK.

THE Metropolitan Board of Works may shortly be called upon to approve of a building alteration, to which no other name than vandalism can be applied. Everyone knows that one of the best examples of Modern Renaissance in London is the Junior Athenæum Club, in Piccadilly. It was originally a private residence, and it is one of the few buildings in which the smallest details have been worked out according to the architect's plans. It has, therefore, exceptional unity, and cannot be tampered with any more than a piece of sculpture. In every club there are discontented members who are eager to make alterations. The gentlemen who represent that class in the Junior Athenæum propose to transform the Piccadilly front of the building by altering the levels of the windows of the principal floor, and cutting a doorway in the wall. What is more extraordinary still, there are architects who are willing to draw plans for the work. In a club bearing so honoured a name, we might expect a little appreciation of architecture. The plans will have to be submitted to the Metropolitan Board, and we hope the application for the alterations may figure among those which have been "refused."

THE Royal Institute of Painters in Water-Colours has been strengthened by the election of Messrs. W. H. WEATHERHEAD, H. CAFFIERI, JOHN SCOTT, and THOMAS PAYNE. On Tuesday Mr. E. BLAIR LEIGHTON and Mr. HENRY ROBERTSON were elected members of the Dudley Gallery Art Society.

THE following competitions have been decided. The plans of Messrs. OSWALD & SON, of Newcastle-on-Tyne, are adopted for the extensive additions to the local co-operative stores, which will include stabling, abattoir, &c., and for laying out the land adjoining in building sites. The restoration of the church of St. George, Stalybridge, will be carried out according to the designs of Mr. JOHN LOWE, F.R.I.B.A., of Manchester. Mr. ALBERT VICARS, Architect, Somerset Chambers, 151 Strand, London, is preparing the design for St. Hugh's Roman Catholic Church, Lincoln, and presbytery. The whole cost of building, we understand, will be the gift of the right worshipful the Mayor of Lincoln, Mr. F. J. CLARKE, J.P. The plans of Mr. HERBERT GREEN, of Norwich, have been adopted for the restoration of Coombs parish church.

THE seventieth Anniversary Dinner of the friends of the Artists' General Benevolent Institution took place on Wednesday, in Prince's Hall, Piccadilly, about two hundred gentlemen being present. The chair was occupied by Mr. W. H. SMITH, M.P., who was supported by Colonel KING-HARMAN, Mr. FRITH, R.A., Mr. POYNTER, R.A., Mr. MACWHIRTER, Mr. MARCUS STONE, A.R.A., Mr. A. CROW, A.R.A., Mr. J. C. HORSLEY, R.A., Mr. C. T. NEWTON, Mr. J. ANDERSON ROSE, Mr. ALMA TADEMA, R.A., Mr. J. AIRD, Mr. FRANK HOLL, R.A., Mr. H. HERKOMER, A.R.A., Mr. C. B. BIRCH, A.R.A., Mr. B. W. LEADER, A.R.A., and Mr. GREGORY, M.P. The Chairman proposed "Success to the Institution," which was warmly received; after which he proposed that of "The Royal Academy," to which Mr. HORSLEY replied. Mr. HORSLEY proposed "The Royal Society of Painters in Water-Colours," coupled with the name of Mr. COLLINGWOOD SMITH. After several other toasts had been proposed, the Treasurer read a list of subscriptions amounting to 1,956*l.*, in addition to a legacy of 500*l.* by Mr. J. J. JENKINS, member of the Royal Society of Painters in Water-Colours.

THE Institute Library is very valuable, but it has not been sufficiently utilised hitherto. Some of the members have desired to make its advantages better known, but the Library Committee have not seconded them. The initiative towards improvement is mainly owing to Mr. RALPH NEVILL, F.S.A., who, in a letter we have received from him, says:—"I see by the Institute Transactions that at the

general meeting Mr. WYATT PAPWORTH confidently challenged Mr. RIDGE to name a library where the books were left accessible to the readers. This was rather rash, seeing that almost within a stone's throw stands the library of the Society of Antiquaries, where the books are so left open. It is, perhaps, familiarity with the practice there that has rendered me, for one, intolerant of the somewhat pedagogic plan at Conduit Street. The two institutions are otherwise very much alike. In both cases the books are of extra value, in both the number of readers is limited, and in both the room is small enough to be well under the eye of the librarian. This latter gentleman at Burlington House is also ready to get any book a member may want. We hear now that the books are all press-marked. What, then, becomes of the piteous complaint of the librarian that he sometimes cannot remember where his own books are?"

A HANDSOME gift has been intimated to the Scottish burgh of Alloa by Mr. JOHN THOMSON PATON, of Norwood, who offers to build a handsome public hall capable of accommodating 1,000 persons, and also rooms suitable for a library, and give 1,000*l.* towards the purchase of books for the library, on condition that the burgh adopts the Libraries' Act. If this is done, Mr. PATON is prepared to carry out his intentions, and hand the whole over to the Burgh Commissioners for the benefit of the town.

THE United Presbyterian Synod have resolved to raise 20,000*l.* to assist in the erection of suitable buildings for new congregations, or in providing permanent buildings for congregations, which have as yet erected only temporary structures, in the rebuilding or enlarging of existing churches where additional accommodation has become necessary, and in providing accommodation for new stations which may ultimately become congregations. On Tuesday last the final arrangements respecting the project were entered into at the meeting in Edinburgh.

THE admirable book on ornament which Mr. OWEN W. DAVIS has been preparing is now ready for subscribers. From the author's experience in designing, we have a right to expect much, and we have not been disappointed. There are eighty-five plates, in which types are given of almost all styles, from ancient Egyptian to our own times. Mr. DAVIS, like all professional designers, cannot confine himself to a single style, and has to produce work that will correspond with the variations of fashion. His versatility is remarkable, although, from the fact that he loyally gave his aid to the late Sir DIGBY WYATT, he appears to have a preference for Italian and the allied styles. The work is pre-eminently suggestive, and has been prepared with an eye to utility rather than pictorial effect. It merits a wide circulation.

THE following extract on sketching from the preliminary students' chapter will suggest the genial way in which Mr. DAVIS treats his subject:—"Our first injunction is, 'begin your subject somewhat smaller than you intend it to be when actually finished. Remember always to do the simple work first, for thus the more difficult will, in its turn, gradually become the more easy; whereas if you tackle the giant first, your strength will be soon exhausted, and the simpler portions will consequently appear the more formidable. Try to draw without outlines: get, in the first instance, an impressional idea of what you require in light and shade, then mass your work up, and carefully fill in the details. Think carefully over your commencement, for be sure you begin well; a good start is half the battle gained. The first quarter of an hour's work may be good or bad for you, and so decide the fate of your drawing. In sketching it is generally found that the first stage is nervous, and the second irksome, whereas the third generally atones for the other two inconveniences. Looking thoughtfully at an object, and afterwards sketching its several features from memory, will do more, maybe, to impress the salient points of it on the mind than would an elaborate drawing made at leisure in front of the object itself. A more vivid impression of a subject is often retained when we are not permitted to sketch it, and, doubtlessly, many an artist has experienced the same visual retentiveness." Suggestions of this kind are precisely those most needed by beginners.

## THE HOUSING OF THE WORKING CLASSES.

THE report of the Royal Commission on the Housing of the Working Classes, which has been so eagerly desired, has at length appeared. The difficulty that awaits a settlement may be described as colossal, and it was requisite that a strong commission should be elected to undertake what are only the preliminary operations in the case. When it is remembered that for the last twelve months Sir CHARLES DILKE, the Prince of WALES, Cardinal MANNING, the Marquis of SALISBURY, Earl BROWNLOW, Lord CARRINGTON, Mr. GOSCHEN, Sir RICHARD CROSS, the Bishop of BEDFORD, Mr. E. LYULPH STANLEY, Mr. W. M. TORRENS, Mr. H. BROADHURST, Mr. JESSE COLLINGS, Mr. GEORGE GODWIN, Mr. SAMUEL MORLEY, the Lord Provost of Edinburgh, and Mr. E. DWYER GRAY, have been closely occupied in investigations, the extent of the subject may be conceived, and it is so manifold in its relations we are surprised to find the first report forthcoming in so short a time. What a blessing it would be if the remedial measures could be accomplished not in one year but in twenty!

The condition of the houses of the working classes in English towns has been so often described, and is so apparent, it may seem a waste of labour to seek more "correct information" than heretofore existed. It must be said that the Commissioners have been unable to add much to what was already known. The advantage of the Commission as we take it is that an official stamp has been placed upon statements respecting overcrowding, sanitary defects, the rapacity of landlords and middlemen, the indifference of local authorities, and other evils, and in consequence they can no longer be impugned. It will be rash for any man to say now that the condition of the humbler classes in English towns is not so dreary as it has been represented.

It is not easy to define the classes of the population which are comprised in the term "working classes." If the wage test be applied, it is found that the dock labourers earn about 8s. to 9s. a week, costermongers and hawkers gain 10s. to 12s. a week, and the average of labourers' wages in Clerkenwell is about 16s. a week. An inquiry was made among workmen in one hundred different trades or callings who lived in the district between Golden Lane and Whitecross Street, and 20s. a week represented the average. It can only be by great self-denial that poor people who have no higher income can pay rent at all. But the extent to which they are mulcted will be apparent from an investigation by one of the inspectors of the London School Board in 1,000 dwellings. He found that 88 per cent. of the humbler classes pay more than one-fifth of their income in rent; 46 per cent. pay from one-fourth to one-half; 42 per cent. pay from one-fourth to one-fifth; and only 12 per cent. pay less than one-fifth of their weekly wages. The average rent of a single room was found to be 3s. 10<sup>3</sup>/<sub>4</sub>d.; of two rooms, 6s.; and of three rooms, 7s. 5<sup>1</sup>/<sub>4</sub>d. Higher prices are obtainable in several parts of the metropolis. The necessity for men to be close to their work compels them to pay far beyond the value of the rooms. Dock labourers congregate in one place, costermongers in a second, artisans following particular trades in a third. Thus, for example, it has been explained that the apparatus required by operative watchmakers is so expensive that no man can afford to have the whole of it: one borrows a part from another workman, and in the course of a day a man may have to borrow three or four times.

The overcrowding which is inevitable from the eagerness to be close to employment has been increased to a terrible extent by the demolitions which have been carried out during late years. If the people had been only driven backwards, like the red men, it might be said that they were merely subjected to a law of our times, but the necessity for their presence remains as before. No one cares where they may sleep or rest, or whether men or women have walked two miles or two yards, so long as they are at work at the prescribed time, or duly return the articles which have been entrusted to them.

It sometimes happens that Royal Commissions deal with questions which are only partially connected with finance. But in this case everything turns on money. It is impossible to provide better or more convenient dwell-

ings for the humbler classes unless by the expenditure of enormous sums, and how are they to be provided? The Commissioners have apparently paid little attention to estimates of works, and are only able to speak in a general way when they have to deal with the outlay that their recommendations involve. Mr. DWYER GRAY quotes an article which was written by the President of the Board of Trade in 1883, in which it is affirmed that "the expense of making towns habitable for the toilers who dwell in them must be thrown on the land which their toil makes valuable, and that without any effort on the part of the owners." Mr. JESSE COLLINGS apparently takes a similar view, for he says that "it should be a recommendation therefore that landowners should be required by law, due notice having been given of a deficiency, to provide sufficient and suitable dwelling accommodation on their estates under laws and regulations to be enforced by local authorities," and he approves of Captain DE WINTON's recommendation that "a man who did not put up two decent cottages for every acre of land he owned should be taxed for the omission." We have nothing to do with the merits of the political revolution that is implied in such a short and ready way of getting out of the difficulty, but if we take the surveyor's standpoint, and judge of the suggestion, we can only say that at present it is impracticable. Landowners are not in a position to adopt so exalted a theory of their duty, and, owing to the complicated organisation of society, it is doubtful whether they can ever be otherwise. One of their difficulties is indicated from what was said by Lord WILLIAM COMPTON. He found that an intermediate on the Northampton estate was receiving 100l. a year from a house in Clerkenwell, for which 20l. a year was paid. But his lordship stated that he shrank from calling the middleman to account for neglecting to repair the tenements, fearing that a rise in rents would be the consequence. This may seem no more than a lack of moral courage, but, whatever it may be called, it is a sample of impediments which, however simple in appearance, cannot readily be cleared away.

The Commissioners recommend that existing legislation should be enforced, and, where necessary, that it should be extended. But regulations for the prevention of overcrowding are in their way as oppressive to the poor as the demolitions have been. Families can be turned adrift from a house which contains the regulation number of inhabitants, but where are they to go? It is admitted by the Commissioners that in the country the wages of agricultural labourers are too low to enable a builder to provide accommodation at a remunerative rate, and it is even harder in the Metropolis. The model dwellings, on which 12,000,000l. have been expended, are not intended for the costermongers, dock labourers, and the lower strata of the wage-earners. All things considered, they are cheaply constructed, and the rents are low, but the opinions concerning the utility of large blocks of buildings are so divergent that the Commissioners seem to be unable to approve or condemn them. However much the projectors may lower their demands, they will not meet the means of the residuum of the population. The Duke of WESTMINSTER let the site for the Gatliff Buildings at the lowest possible rent, and advanced the money for the erection at three per cent., on the condition that the buildings should be available for the very poor. But the Commissioners decline to say whether the rents are at a rate which would put the dwellings within reach of the most necessitous class.

It is to be feared that the class referred to cannot hope to inhabit new buildings unless the proprietors or the State are prepared for financial losses. The best means to evade the difficulty appears to be the adoption of TORRENS's Act, which has never been sufficiently tested. Among the causes which have left it to be so unused are the cumbrous preliminaries which are demanded before it can be set in motion. At present a writ of mandamus from the High Court must be obtained. The Commissioners propose that the order or direction of the Home Secretary should be enforceable by an order of the Court instead of by mandamus. In connection with this part of the subject the separate report by the Hon. LYULPH STANLEY and Mr. STANLEY is of very great importance.

One remarkable suggestion is offered by the Commissioners. They ascertained that forty-five acres of ground are occupied

in London with four prisons, Coldbath Fields having nine, Pentonville ten, Millbank twenty-three, and Fulham three and a half. The last is the only one which is not situated in a densely-populated district. The Commissioners propose that the sites of the remaining three "should be conveyed to the Metropolitan Board of Works, in trust for the benefit of those portions of the town which are most overcrowded." But it is expected that the Government will set the example of sacrificing property, for we are told that "in fixing the price at which the sites should be so conveyed, due regard should be had to the purposes for which they are so required." The Marquis of SALISBURY recommends that the sites should be sold at the prices given for them originally, on the ground that it is to the circumstance of London being the seat of Government that the increase of population and the diminution of house room are mainly owing. His lordship recommends that the dwellings to be erected should be of a lower standard than those of the PEABODY Trust. The suggestion manifests the great difficulty of finding sites within the Metropolis for the dwellings, and the necessity for exceptional measures sooner or later. But if the precedent is once set of paying only cost price to owners, there is no knowing where it will end, and thus "prairie value" for London land may one day be the recognised standard when a building site has to be taken for quasi-public use.

In the report the Commissioners are severe upon surveyors, who, not being sufficiently advanced in their political economy, endeavour to obtain the full measure of value for their clients' property. Mr. SHAW-LEFEVRE stated that 400,000*l.* out of 1,100,000*l.*, which was lost by the Metropolitan Board of Works on improvement schemes, was a result of excessive valuation. Mr. CHAMBERLAIN in describing the Birmingham clearances strongly objected to the principle laid down by Sir HENRY HUNT, the arbitrator, by which they were forced to purchase temporary interests which involved the necessity of giving compensation for businesses in connection with them. It is proposed that the "fair market value," and no more, should henceforth be given to the owners of property that may have to be taken, and that excessive assessment of trade profits should be ignored. The emoluments of lawyers and surveyors are to be checked by fixing a scale of professional charges, and as appeals have no other use except the increase of fees, they are to be abolished unless special permission can be obtained from a superior Court. In other words, the spirit of self-sacrifice is to be enforced all round under pains and penalties. In ordinary cases a valuer is expected to recognise all contingent improvements, and the value of ground has in this way been increased fivefold, and yet at the higher price it was sold cheap. But the Commissioners believe that if a place is of a low value it must remain so. "There are arbitrators," the report says, "who seem not to exclude from their minds the improvement of the property that would be due to the scheme itself, and give a prospective value to the unhealthy property in consequence of their impression that it would be increased in value when the improvement was effected." This may seem an unfair way of going to work to people who wish to buy property at their own price, which is the position assumed by the Commissioners, but the assumption of prospective improvement is every day practised in Court. A corresponding principle is adopted by landowners when they are fixing the rent of property, and introduce the worth of a tenant's improvements as factors in the calculation. We are astonished to find Mr. GEORGE GODWIN could allow statements to go forth like those in the report about surveyors without making an effort to qualify them.

Surveyors are supposed to derive great profits from all cases relating to the purchase of property for improvements, but as a matter of fact their fees are moderate and are dearly earned. The lawyers draw large sums. Thus, a sum of 10,000*l.* was paid for legal expenses, in Liverpool, in respect of compensations amounting to 72,000*l.*, and one case was mentioned where the value of the house was 20*l.*, and the solicitor's charges amounted to 57*l.* But a similar costliness was found to prevail in transactions which did not relate to sanitary improvements. A land company bought twenty-seven plots of market garden, each of which was worth 4*l.* 8*s.* 4*d.* The legal expenses amounted to 14*l.* per plot, although there was no difficulty

with the title. A workman stated that he gave 220*l.* for his cottage and 66*l.* for the deed. But what is to be done in such cases? The Commissioners are unable to suggest a remedy unless there is a "reform of the law," and that we do not expect until the millenium.

There is a supplementary report signed by ten out of the sixteen Commissioners, which has a more extensive application than the general report. It says that "the prevailing system of building leases is conducive to bad building, to deterioration of property towards the close of the lease, and to a want of interest on the part of the occupier in the house he inhabits; and that legislation favourable to the acquisition on equitable terms of the freehold interest on the part of the leaseholder would conduce greatly to the improvement of the dwellings of the people of this country." With this opinion all readers of *The Architect* are likely to agree, and they could cite many cases in support of it. Would it not be well for the Legislature to try the effect of more facility in converting leaseholds into freeholds?

Mr. GODWIN has a memorandum recommending his favourite material concrete in the walls of houses for the poor. But although indispensable in the interiors of model dwellings, we believe it has not once been used for the external walls of those dwellings. There is also a reference to the Familistère established by a manufacturer of stoves at Guise, in which 700 or 800 workmen and their families are housed at very low rents. Thus a furnished room costs 6*s.* 8*d.* a month, one unfurnished 3*s.* 9*d.*, and a bed in a dormitory can be had for a penny a night. Yet the proprietor is said to derive 6 per cent. on his outlay.

#### PREHISTORIC AMERICA.\*

THE word "prehistoric" is one of the vaguest in any language; for, since it is difficult to define what history means, or to say when one was first produced, the termination of prehistoric years cannot be fixed, much less their commencement. What it may be taken as implying is an answer to the question, When did men first appear on the globe? As geological time is measurable by strata, we may ask, in other words, How far downwards must we go to lose all trace of the species? They are difficult questions to answer, and in many parts of the world there are enthusiasts who are labouring hard for solutions. The authority of CUVIER, who pooh-poohed the notion that men could live amongst extinct animals, for a while retarded the inquiry, and since his time prejudice tried to take his place; but it has been found impossible to put a stop to research. No branch of the science of archæology can display such strong evidence of enthusiastic research as that which relates to the earliest existence of man.

Many reasons combine to make America a favourite hunting-ground for explorers of the science. In the first place, a large part of the Continent has been less subjected than Europe to alterations at the hands of the inhabitants, and, consequently, the worth of evidence is less likely to be impugned on frivolous grounds, although the amusing nonsense which Mr. BRET HARTE wrote about WHITNEY's discovery of the "Calaveras skull" is enough to show that anthropologists are not secure from derision in the States. In the second place, there is a nearer approach to completeness in the evidence than we have in Europe. The Indians of the present day correspond, in respect of customs and works, with the records which are furnished by Peruvian and other remains, and we can trace (allowing, of course, for many links in the chain not being forthcoming) the relation of living people to those of a primitive age.

The book of the Marquis DE NADAILLAC, of which a translation has been published in London, contains an account of the researches and discoveries in the Western Continent. It is all the more valuable because the author believes that, with a subject so extensive, and about which so little is known in proportion to the extent, it is premature to draw conclusions. M. D'ANVERS, in his translation, has had the advantage of Professor ROGER SMITH's aid in the description of architectural remains. The volume has

\* *Prehistoric America*. By the Marquis de Nadaillac. Translated by M. N. d'Anvers. John Murray.

accordingly a claim to be read by others besides anthropologists. It is interesting in its way, but the illustrations, which are mainly taken from American blocks, have not the finish that characterises those ordinarily found in books which are issued from Albemarle Street.

According to Professor WHITNEY there is safety in declaring that the human race in America is at least of as ancient a date as that of the European pliocene. Another authority, who based his calculations on the growth of forests, says that one skeleton must have been lying in the ground for 57,000 years. With the same data a Dr. DOWLER gives the time as 14,400 years. But questions of the kind depend on the more or less rapidity with which geological operations have been conducted, and as it is difficult to form a standard that will serve as an unit of measure, discrepancies must arise in the calculations, and it would be vain to attempt their reconciliation.

There is another factor besides time, and that is race. Leaving the consideration of skulls and other bones to anatomists and geologists, we have evidence in the form of kitchen middens and clay mounds which are the legacy of primitive inhabitants, although belonging apparently to a much nearer age. They testify to many of the characteristics which are still found in existing races. It is evidence that cannibalism (which may have been a relic of Polynesian ancestry) prevailed to an enormous extent. But, as the author says when describing the remains on the Suguassu River, "the cannibalism of these ancient inhabitants of Brazil need not surprise us, for at the present day there are in this empire, so advanced in many respects, cannibal tribes numbering altogether no less than 70,000 or 80,000 souls." Mounds of various forms are found in many parts of the Continent. They are not laid out on uniform plans. Some are circular, others are triangular, but the primitive VAUBANS often gratified their artistic instincts by arranging the earth in the forms of birds, animals, and even of men. The number will be suggested by a few figures. Ohio is said to contain 10,000 mounds, and in the state of New York 250 enclosures have survived. The execution is considered remarkable, especially if it is remembered that the men who constructed the mounds were without the assistance of beasts of burden to carry materials from a distance. The mounds have been divided by SQUIER into six classes, viz., defences, sacred enclosures, temples, altar mounds, sepulchral mounds, and mounds representing animals. It has been supposed that they were not constructed merely for temporary purposes, and the Indians have apparently adopted them as models. Mr. LUCIEN CARR, who is one of the latest authorities on the subject, believes in the kinship between those old builders and the races that give so much trouble to the United States Government. "We are fully justified," he says, "in claiming that the mounds and enclosures of Ohio, like those in New York and the Gulf States, were the work of the Red Indians of historic times or their immediate ancestors. To deny this conclusion, and to accept its alternative, ascribing these remains to a mythical people of a different civilisation, is to reject a simple and satisfactory explanation of a fact in favour of one that is far-fetched and incomplete, and this is neither science nor logic."

When the Spaniards entered the district that is now known as New Mexico they were amazed at the elaborate excavations which had been made in rocks for dwellings, and the structures which were formed wherever the ledges of cliffs gave a footing. These remarkable works are supposed to have been used as refuges in case of invasion, and hence the network of chambers and the almost inaccessibility of the positions. It is, however, noteworthy that in this case also there is a sort of correspondence between past and present. The Moquis and Zuñis now build in a similar style to the Pueblos. Whether made of stone or of adobe, the buildings are alike and regular, with small rooms, trap-doors instead of stairs to give access to apartments, and estufas or common rooms. The pottery corresponds with that made by the cliff-dwellers, as well as the arrows and implements.

In every work which treats of the ruins of Central America we find a reference to the Toltecs, who were supposed to have erected the gigantic buildings of which ruins still remain in Palenque and elsewhere. The origin of the

name is uncertain. M. CHARNAY, who explored the district five years ago, maintains that it is not a name of race, as it is applied "to every ingenious tribe that has left behind it any monumental traces of its presence; in short, *toltec* means builder, architect, engineer." Whoever they were, they held sway in Mexico from 667 until 1051. Palenque is supposed to have been a sort of Mecca, and the only remains are suggestive of palaces and temples. The principal ruin—which was the palace—measures 310 feet by 260 feet, and stands on a pyramidal base 40 feet high. The walls are coated in stucco on both faces and painted. The pilasters are adorned with figures, and there is a vast amount of reliefs throughout the building. Casts of the principal figures are to be seen in the Trocadéro Museum, Paris. M. CHARNAY ascertained that the artists adopted a plan which is often recommended in modern times. The figure was first modelled, and then the garments and ornaments. Every piece of apparel, every article of ornament was moulded and laid on separately.

The subjects of the sculpture and the style varies more or less throughout Central America, but speaking generally, there seems to have been a desire to create figures which might excite terror in the spectators. There are vases and statues besides reliefs, and they could not have been produced without the exercise of extraordinary patience. First of all, we are told, blocks of granite or porphyry had to be quarried with implements formed out of quartz or obsidian, and then sawn into slabs for the reliefs by means of agave-fibre and emery. An outline of the figure was drawn on the stone, and the surrounding parts were removed and the round brought out by chipping with a piece of flint. The plain portions were polished by flat stones or emery. The extent to which picture-writing was used made artists a necessity. An arrow represented an enemy, and the names of places were often symbolised by figures of animals or objects which embodied the idea expressed in the word. As in Egypt then, there were symbolic as well as imitative symbols, and the former are still undecipherable.

There was at one time a tendency when treating of works like those found in Central America to exaggerate their qualities, and to represent them as works of art. Mr. STEPHENS, who may be called the pioneer of Central American exploration, is an example, although in his case the illusion was pardonable. A man who cut his way through the forest was likely to be more impressed with the power of the gigantic figures he found in Copan than a critic who judged it from a distance. Photography and casts have enabled the public to realise the character of the originals, and any value that may be attached to them does not arise from their æsthetic interest, but from the evidence they afford of the history of evolution.

### MOUNTSTUART HOUSE, BUTE.

THE rebuilding of Mountstuart House, which, it will be remembered, was destroyed by fire, has now been completed. This palatial and massive edifice is, says the *Glasgow Herald*, the most magnificent of all the numerous residences of the most noble the Marquis of Bute. It occupies an area of little less than an acre, and is built in the style of architecture which was predominant during the latter half of the thirteenth century. The mansion stands on a layer of concrete, and is five storeys in height, and commands a pleasant view of the river Clyde, with all its favourite summer resorts. The walls, which are of great thickness, as well as the balconies and turrets, are built of stone procured from Corsehill Quarry, near Annan. In the middle a great watch tower rises to the height of 120 feet, with a balcony all round at the top, from which a grand view may be enjoyed.

The basement floor is constructed on fireproof principles. The window sashes are all made of iron, and the ceilings of concrete arching resting on rolled iron beams. The finishing of this floor is in yellow pine, and comprises the business, waiting, and cloak-rooms, wine and beer cellars, breakfast-room, and vaulted chamber, &c. The ceiling of the vaulted chamber is tastefully groined with polished Dunmore stone, having bands of red Corsehill stone every 18 inches; and when the chapel is built there will be a communication between the crypt and this chamber. The ground floor contains a grand hall entirely composed of marble and alabaster—a marvel of the marble-cutter's art. There are several kinds of marble in

its construction, comprising Cipolino, Emperor's Red, Dove, Pavonazetta, Carrara statuary, and Frosterly fossil. The columns on the ground floor are executed with Cipolino, while the four main corner piers are made of Pavonazetta, with small circular Cipolino pillars in the angles. The capitals are all gracefully carved in foliage and animals. There is a gallery and ambulatory all round. The balustrade is made of alabaster, while the plinth supporting same is executed with Frosterly fossil—a marble that is full of shell fossils. The floor is composed of two thicknesses, the lower thickness being of red pine laid diagonally, and the upper one of oak. The columns, piers, and arches are of Pavonazetta, Emperor's Red, Cipolino, Dove, and Carrara statuary. Above the ambulatory comes the clerestory, built partly of stone and marble. Immediately below the clerestory are beautifully carved canopies, executed in alabaster, for the reception of small statuettes. The ceilings of the ambulatory and grand hall are groined in yellow pine, with carved bosses at the intersection of their ribs. To the east side of the grand hall are the drawing-rooms, which are grand and stately in appearance. In the small drawing-room is an angle-nook entirely composed of alabaster and various kinds of marble. The ceilings are exceedingly beautiful, that of the small drawing-room being richly panelled in plaster and French walnut. The fireplaces in these rooms, as well as in all the principal rooms, are entirely made of marble. The doors leading into the balconies are of teak, with the upper half filled in with lattice-work, while the other doors are made of walnut with plain and quatrefoil panels. On the west side of the hall are the dining-rooms. The main dining-room, which measures 45 feet 6 inches by 22 feet 6 inches, is capable of entertaining eighty guests. The ante-dining-room measures 10 feet by 22 feet 6 inches. These magnificent and well-proportioned rooms have the most elaborate tracery-headed windows in the whole building, and are filled in with well-designed lattice-work. The interior finishing is in wainscot. At the south end of the dining-room is a service-room, with dinner lift and hoist. On the north side of the hall is the grand staircase, executed in marble, having a groined ceiling in concrete, and finished with plaster. The ribs are made of Sicilian marble. The ceiling, which is about 40 feet in height, is supported by a marble centre-shaft, from the top of which spring the various ribs forming the ceiling. The steps of the stair are of Carrara statuary. At one end runs a balustrade neatly worked in alabaster and metal. Adjoining the grand staircase are the libraries, which comprise three well-lighted and large-sized rooms. Off the principal library is a strong room and alcove—the former being a stone safe for keeping the archives and records, &c., belonging to the Marquis. Beyond the libraries, to the south, is the nursery hall and vestibule leading to the proposed new conservatory. The ceiling is groined with stone ribs and concrete, and finished with plaster, and is supported by pillars of porphyry—a kind of local granite—having gracefully carved capitals and moulded bases in Corsehill stone. The vestibule is separated from the hall by a stone arcading. The floor of the hall is laid with dark red tiles, while that of the vestibule is executed in mosaic.

On the principal floor are Lord and Lady Bute's private rooms, &c. Lord and Lady Bute's rooms are similar to one another, the bow windows in each having a groined walnut ceiling, along with a neatly-designed marble arcading running parallel with the window. The ceilings of these two rooms are all temporarily finished in yellow pine. Off Lord Bute's room is a conservatory containing two ornamental wrought-iron couples supporting the glass roof. In connection with Lord Bute's room is a small private stair made in the thickness of the wall, and leading to the small drawing-room. The bedrooms on this floor are most capacious, and well finished in wainscot and yellow pine. The doors are of wainscot and walnut, and have a large quatrefoil panel in the upper half, while the lower half is filled in with three sunk moulded and fielded panels. The windows are all of teak. The floors are of American oak. The ceilings are panelled with plaster and yellow pine ribs and mock beams. On the attic floor are the maids' and bachelors' rooms, finished in yellow pine, and both spacious and comfortable. The fireplaces are executed in moulded stonework, with wood jamb mouldings, frieze, and moulded mantel-shelf. The upper attic is entirely devoted to servants' rooms, which are roomy and well supplied with light and heat. Running round the house, on a level with the attic floor, is a verandah, one-half of which is covered. The walls are faced with thin red Chilton's bricks, procured from St. John's, Ipswich, and bedded in Portland cement and Stettin oak framing. The roof of the covered portion is in small panels of Stettin oak, and the rafters project over the eaves with moulded ends. The projecting part of the roof is supported by numerous granite pillars, having moulded Corsehill bases and carved capitals. A charming view of the neighbouring counties can be enjoyed from this verandah. The billiard room is at the south of the building, and immediately over the grand staircase. It measures 33 feet by 27 feet 6 inches, and has two carved antique-looking stone fireplaces, one at each

end of the room. The ceiling is divided into three semi-circular portions, and panelled in wainscot. In the nursery wing are the swimming and Turkish baths. The swimming bath measures about 30 feet by 25 feet, and has a groined roof made of terra-cotta, and supported by Aberdeen granite columns. The floor of the bath slopes so that the water at one end is about 2 feet 6 inches deep, while at the other end it is nearly 7 feet or 8 feet deep. A small dressing-room in connection with the bath is lined with tiles, and groined in the ceiling with terra-cotta. The Turkish baths which adjoin have groined concrete ceilings with stone ribs, supported at regular intervals with stone pillars. Above the swimming and Turkish baths are the nurseries, comprising in all seven rooms. The kitchen offices have all the latest contrivances in the way of cooking. With the exception of the grand staircase, all other stairs are executed in Arbroath stone.

The house is heated by hot-water pipes. All the rooms are lighted with the incandescent lamp, having a luminosity equal to 20 candle-power. The plumbing employed throughout the building is executed in the English style of workmanship, and, like the drainage, has had very careful attention. The water supply is from the new water-works recently made in the moors about two miles distant, and is brought to the house in cast-iron pipes which supply three large-sized storage tanks in the great tower. The bell-hanging is constructed on the electric principle, with all the latest improvements, and embracing ten miles of wire. The glazier work is of the most elaborate description, almost every room having a design of its own. The plans and working drawings were furnished by Mr. R. Rowand Anderson, LL.D., architect, Edinburgh. The house has been supervised by Mr. J. H. White, clerk of works. The contractors for the whole works are Messrs. Watt & Wilson, 93 Hope Street, Glasgow.

## ANCIENT MARBLES

OF the ancient white marbles, the most famous were the Parian and Pentelic of Greece. The Parian marble was obtained from the island of Paros, one of the Cyclades, and was, perhaps, the most highly esteemed of the white marbles known to the ancients. It is not pure white in colour, but is rather of a yellowish tint. In grain it is comparatively coarse, but it worked with great exactness and received the most perfect polish. This it retained even after long exposure; so that the masterpieces of the sculptor's art wrought from it—the *Venus de Medici*, &c.—have come down to us in a state of perfection that is largely due to the indestructible nature of the material of which they are composed.

The Pentelic marble, which divided with Parian the favour of the Greek, is finer grained and whiter than the latter, but it is apparently less durable. As its name indicates, it was taken from the quarries on Mount Pentelicus, in the immediate vicinity of Athens.

With the introduction of Greek art into Rome there was naturally an importation of the material in which this art was embodied in Greece, and the quantity of Greek marbles used in Rome, both for statuary and construction, seem to have been very large, especially during the earlier centuries of the Empire. It was not long, however, after the Italian peninsula had come under Roman sway, before the Italian marbles, now so well known, were discovered and brought into use. Among these the white marbles found on the shore of the Gulf of Spezia early attracted attention, and in the Augustan age the Carrara marble had nearly supplanted the Parian and Pentelic, and the enormous quantity of marble consumed in the decoration of the Imperial City was chiefly supplied from this source. The statuary marble of Carrara combines the good qualities of the two Greek varieties which have been mentioned, though both may be found exactly imitated among specimens of it. On the whole, it is thought by sculptors to combine in a greater degree than any other known statuary marble all the possible excellences of a material of this kind.

Among the famous coloured marbles contained in the Jacobini collection we may mention the following:—

Nero Antico is a jet-black marble of fine and homogeneous grain, and of such closeness of texture that it receives the most brilliant polish. Its colour is also apparently unchangeable, doubtless in virtue of its hardness, since the softer black marbles—which are in fact unmetamorphosed black limestones—lose their colour to a degree on exposure, by the oxidation of the carbon which produces it, and they frequently become quite gray. The antique black marble is now eagerly sought as a ground for mosaics and for other purposes, but this demand is only supplied from the ruins, as the locality of the quarries which furnished it is at present unknown. From its resemblance to the Belgian black, it has been suggested that it might have been derived from the same source; but the comparative abundance of the Nero Antico at Rome and the mag-

nitude of some of the pieces which are still extant, almost preclude the acceptance of the theory.

Rosso Antico was the ancient red marble. Much of this is uniform in colour, and that a rather bright red. In some instances, however, it is darker, and more or less mottled. This seems to have been used by the Etruscans before the advent of the Romans, as beautiful and highly wrought specimens of it were obtained by the writer on the sites of more than one of the Etruscan cities. The place from which the Rosso Antico was derived is not certainly known, though a recent writer claims to have discovered the ancient quarries near the Bay of Scutari, in Greece.

Giallo Antico was the ancient yellow marble. This was perhaps the most admired of all the beautiful marbles used by the luxurious Romans. As its name implies, its prevailing colour is yellow, generally a light tint, somewhat similar to that of the Sienna marble, but more uniform and positive. Other varieties are bright yellow or orange, and it is sometimes variegated with dark lines. This marble is very fine in texture, and takes a beautiful polish. The quarries from which it was obtained are not now known, but it is suspected that they were situated in Africa.

Cipolino is a grey marble, much used by the Romans, and is the material which composes the columns of the temple of Jupiter Serapis at Baia; those which have been perforated by boring mollusks to half their height marking the former submergence of the site of the temple. It is composed of bands or irregular layers of white marble, mixed with others of talcose or steatitic material.

Apparently several distinct varieties of marble are known in Rome under the name of *Pavonazetta*, or peacock marble. In a collection of antique marbles made by the writer many years since in Italy, one of the most beautiful, found in the Forum at Rome, was coloured with white rounded spots on a red ground. This was called *Pavonazetta* by the Italian sculptors; but another, and perhaps the true *Pavonazetta*, is coloured with wavy bands of green, bluish-grey, and white, which form somewhat rounded and highly-coloured figures that bear an imperfect resemblance to those of the peacock's tail. Of this marble many beautiful examples are to be seen in the churches of Rome.

Oriental alabaster is a stalagmitic marble, though generally, but of course incorrectly, called an alabaster. Its prevailing colour is a yellowish white, but it is frequently banded with darker shades of yellow and red. This seems to have been a highly-prized ornamental stone among the ancients, as many specimens of it are found in Egypt, Syria, Greece, and Rome. It was the favourite material for vases, urns, &c., and these are found in the oldest sepulchres, quite a number being contained in the interesting collections made by Colonel di Cesnola on the island of Cyprus, now in the Museum of Arts at New York City. Magnificent slabs and columns of this beautiful stone are to be seen in the churches of Rome, especially in that of San Paolo fuori le Mura. The quarries of the Oriental alabaster are in Egypt. They were for centuries lost sight of, but have been lately rediscovered, and are now worked.

## TESSERÆ.

### Titian and Claude's Landscapes.

SIR C. L. EASTLAKE, P.R.A.

THE simple question, What is the general character of the object to be represented? explains the style of Titian, for he always penetrated it. Many appearances in nature have more than one general characteristic by which they are universally recognised. Thus, while Titian aimed at the quality of depth in the sky, Claude seems to have loved another of its attributes, and reflecting that the sky was the source of light, he seems to have determined that brightness was its universal character. Claude seems to have copied the forms of trees in a relative point of view: their forms assist his composition, and their tone gives brightness to his sky; but Titian always expressed the universal character of a tree, viz., growth. It is always bursting with the efforts of vegetation. The forms are hence often peculiar, and at first one would say that Claude is more general in his choice of trees; but what appears accident in Titian's case is really the character.

### Vignola.

F. MILIZIA.

He was of an agreeable complexion, sincere, prompt to assist others, patient, and cheerful. Architecture is eternally obliged to him—he formed a system and prescribed rules. Convenience, solidity, and all the mechanical parts were well understood by him. He was fertile in invention, elegant in his ornaments, and majestic in his arrangements. As he increased in experience, he improved in the correctness of his profiles.

With the aid of a little philosophy he would have corrected architecture of those abuses which neither his contemporaries nor the ancients had perceived. But the age of philosophy was not yet arrived. His book, therefore, which is the first usually put into the hands of youth, and, like the breviary to a priest, perhaps the only one interesting to architects in their old age, has done more evil than good. Vignola, in order to render his rules more general and more easy in practice, has now and then altered the finest proportions of antiquity. In the divisions of certain members, and in some of his mouldings, he rather inclines to harshness, and, by making his pedestals too high, he takes from the importance of the column. There is no system more easy than that of Vignola, but this facility is procured at the expense of architecture herself. The model for his Doric was the theatre of Marcellus; but finding some of its mouldings not conformable to the proportions he had established, he made no difficulty in accommodating them to his rule. He has taken other parts from various Doric edifices, and united them with those of the theatre of Marcellus.

### English Wall-Painting.

J. G. WALLER.

The colours generally used were of the commonest kind, mostly earths, as in fresco, or of some mineral origin. The chief were colcothar or Indian red, for they are nearly the same, red ochre, yellow ochre, terra verde, verditer, and native cinnabar. Neither of the two last are used in fresco-painting, and verditer—both blue and green—are colours which fade and change very easily. To these may be added "lamp black" and white, made from lime. Cinnabar, which stands in the place of vermilion, grows black in contact with lime, and this accounts for some reds turning quite black, probably assisted by damp. All our earliest paintings are monochromes or very nearly so. As regards the decoration of oaken screens of which the eastern counties show many fine examples, both "tempera" and oil were used. Indeed the latter was very much employed in this country in early times, as our records prove. But it is very doubtful if this was for any delicate work. Many of the screens in Norfolk and Suffolk prove the influence of the Flemish artist, and we know many migrations from Flanders took place, bringing superior manufactures and doubtless a superior art practice. If we presume the use of oil in the painting of these screens, it seems always to have been applied on a ground of gesso, just as in preparation of panels by painters of both Flemish and Italian schools. But we cannot be sure that many which now seem to us as painted in oil were not first executed in tempera, and afterwards varnished. It is, however, of little importance. But there are specimens of tempera simply, as well as in oil or tempera varnished. On the screens we get a superior range of colours: a finer blue, a brighter green, a preparation probably of vermilion. The gilding is excellent, and in one or two instances, late in the fifteenth century, stamped processes are used for such parts as the shafts of the canopy, executed with much beauty and subtlety. Yaxley, Suffolk, offers an example.

### Stained Glass Windows.

E. CHEVREUL.

My ideas on the employment of stained glass for windows may be summed up in the following terms:—(1) they produce their utmost effect only in the rose windows, bay windows, or pointed windows of large Gothic churches; (2) only when they present the strongest harmonies of contrast, not of colourless transparent glass with the black produced by the opacity of the walls, iron bars, and strips of lead, but of this black with the intense tones of red, blue, orange, violet, and yellow; (3) their designs must always be as simple as possible, and admit of the harmonies of contrast; (4) while admiring painted windows, of which a large number consist of paintings of undoubted merit, especially in regard to the difficulties overcome, I confess that it is a kind of painting which should not be much encouraged, because it never has the merit of a picture properly so-called—it is more costly, and will produce less effect in a large church than a stained window of much lower price; (5) windows of pale grey ground, with light arabesques, have a very poor effect wherever they are placed.

### Identification of Stone.

C. H. SMITH.

It is not very likely that a well-developed oolite would be taken for a sandstone, but I think it extremely probable that a casual observer might mistake some of the highly crystalline limestones for sandstones, and a very fine grained sandstone might just as likely be taken for a limestone. The more scientific method of detecting the difference is to test them with an acid. Diluted muriatic acid is perhaps the best; but this is not a very agreeable fluid to carry in the pocket, and not always to be obtained conveniently. And if it were, some of the beautifully crystallised magnesian limestones are at first so amazingly slow in their progress of effervescence that an inexperienced

person might decide erroneously without waiting for the actual result. The method most convenient on all occasions, and which I am inclined to believe will rarely, if ever, lead to false conclusions, is to try if the specimen will scratch glass with a slight pressure of the hand. Common crown glass is better for this purpose than any other, and if it makes a mark that cannot be wiped off with the finger, there is no doubt of the sample being a sandstone, composed chiefly of quartz or silicious grains. There are, I admit, other substances which will scratch glass, such as diamonds, rubies, and most of the precious stones, but these are never found in enormous masses. Chert or flint will also do the same, but no one would test such materials under an impression that they might be sandstone, their appearance alone being a sufficient proof. The method I have proposed is only intended for such stones as, by their resemblance to others, might probably lead to erroneous conclusions.

#### Selection of Stone.

SIR H. T. DE LA BECHE.

There was some excuse for the accidental durability of the stones employed in public or large private edifices in former days, when the mineralogical structure of building materials was so little understood; and the architects of those times could not always have churches or castles before them, from which they might judge of the relative durability of any stone they were about to employ, the quarries opened by them being also then often first worked to any considerable extent. The architects and engineers of the present day cannot, however, avail themselves of these excuses, for the necessary chemical and mineralogical knowledge is readily acquired; and the number of public and private edifices of various dates scattered over the country is so great that the relative durability of the materials employed in their construction can easily be seen. It is nevertheless well known that with some few exceptions the mineralogical character of the stone employed in public works and buildings has hitherto received little attention from either architects or civil engineers in this country, more especially from the former, whose value of a material seems commonly to have been guided by the opinion of the mason. Now the mason seems almost always guided in his opinion by the freedom with which a stone works—no doubt an important element in the cost of a building, but certainly one which should not be permitted to weigh heavier in the scale than durability—and hence many a fine public or large private building is doomed to decay even, in some cases, within a few years.

#### French and English Masons.

CAPTAIN FOWKE, R.E.

There is a very wide difference between the manner of working of an English and French stonemason, for while the former makes use exclusively of his trowel for taking up and laying mortar, using his hand merely in placing and arranging the stone, a French workman takes up a trowel full of mortar in one hand and a handful in the other; and really, to see him at work, the first impression is that his trowel is a mere auxiliary, and that the principal part of the work is done with the other hand. Their work, nevertheless, is remarkably good and firm; part of this, however, may be attributed to the admirable mortar which they employ, and to the ease with which the stone generally used is capable of being brought into any required shape.

#### Boss Stones.

PROFESSOR WILLIS.

The employment of a boss stone, that is, of a stone placed at the intersection of two groin arches, and provided with beds for the reception of the four ribs that thus meet upon it, is not coeval with the use of groin ribs, as might be at first imagined. In the early Norman examples, one pair of the diagonal ribs was first erected as a complete arch, and the other pair of ribs set up separately, and made to abut against the first arch, meeting either a voussour, or a joint, as the case might be. A very curious instance of this kind may be seen at the east end of the Norman crypt at Gloucester. The compartments of the aisle which run round the circular end are necessarily trapeziums in plan. The two diagonal groin arches are each a semicircle in a vertical plane, and they consequently intersect, not at their crowns, but at a point considerably lower down. That no geometrical method had then been invented to obtain the form of the boss stone at the intersection is evident, for one diagonal arch is complete in itself, and the other, as above, being built in two separate halves, abuts awkwardly and obliquely against the first, having been evidently left to shift for itself, just as the vaulting surfaces were in the same early period. In the round church of St. Sepulchre at Cambridge, the compartments of the aisles are also trapeziums upon the plan, but the awkwardness of making the semicircular groin ribs intersect below their crown is very ingeniously got rid of. Those points of the outer wall from whence every pair of

neighbouring ribs spring, are placed at such a distance from each other that the four feet of the diagonal ribs in each compartment really stand upon a rectangle, and the ribs therefore intersect at the crowns in the usual manner. In the eastern transepts of Canterbury there are boss stones with branches to receive the four diagonal ribs, but instead of attempting to work these branches to the same vertical curvature as the ribs they respectively receive, the branches are made straight and horizontal, and the ribs abut against them, forming a broken or discontinuous curve. Similar botchings may be observed in many early examples, and they are very curious, as showing the necessity for the geometrical system that afterwards arose.

#### Prescribed Proportions.

SAMUEL HUGGINS.

The Italian masters had no right to give canons for the proportions and profiles of the orders, which were neither more nor less than recipes for designs to supersede thought, and the exercise of taste and feeling and artistic ingenuity, which they were calculated to do whether they were so intended or not. Classic proportions might vary to suit the proportions of building materials, as well as different climates and different situations in a building. An elegant elongated columnar ordinance—that is, an attenuated Italian style not altogether devoid of Classic grace of detail—might, I fancy, be composed and proportioned for execution in iron.

#### Gelatine Moulds for Reproductions.

H. H. COLE, R.E.

In every class of piece-moulding the method of covering the carved surface with a number of inelastic moulds capable of being individually removed with ease is theoretically the same; but the perfection of the plaster piece-moulding depends on the skill of the moulder in so disposing of the moulds as to have the fewest possible joints when the piece-moulds have been made to completely cover the carving. These piece-moulds are, in turn, covered, or rather backed, with larger moulds, which serve to hold them in position when the cast is being made. In the gelatine process the backing, or wall, to hold the mould is the primary work, and then hot liquid gelatine is poured between the backing and the carving. The process is briefly as follows:—The carved surface is thoroughly cleaned and covered with rolls of modelling clay. The outer surface of the clay is smoothed, and a plaster coating or wall built against it. This wall is then removed, and the clay taken away; when replaced, an interval of the exact thickness of the clay will exist, and into this interval is poured gelatine. After twelve hours the gelatine will have attained the consistency of india-rubber, and may be peeled off the carved surface. In cases of deep undercutting considerable force is required to effect this. The gelatine mould is then laid on the wall which supported it in the liquid state, and a plaster cast, or fac-simile, is made. In every distinct operation the greatest care and experience are required in order that the natural good qualities of the gelatine may be allowed perfect freedom in producing an accurate copy.

#### Strength of Timber Beams.

A. ASHPITEL.

The formulæ given by Tredgold are too abstruse for general purposes. There is, however, one given by Nicholson which is simple, and not far from the truth. A number of experiments were made on pieces of various woods, each 1 inch square and a foot long, and the weights which broke them recorded. Then as this weight  $c$  is to the length of any given beam in feet  $l$ : so is the weight the beam will have to bear (in lbs.)  $w$ : to the breadth  $b$  multiplied into the square of the depth  $d$  of the intended beam; or as  $c:l::w:b \times d^2$ . Any of these three being given, the fourth is easily found. The breaking weight of Memel fir he gives as 330, that of oak he gives as 810; but this last seems too much. Suppose there is a warehouse 16 feet wide, the girders of which are 10 feet apart, and each superficial foot is to carry 3 cwt., or 336 lbs. Then as each girder supports  $16 \times 10 = 160$  feet superficial, and as each foot is to carry 336 lbs., the total weight to be carried is 53,760 lbs. distributed over the whole, or half this, 26,880 lbs., in the centre. Then as  $330:16::26,880:1,303$ , or the breadth multiplied into the square of the depth. But this is breaking weight, and no timber ought to be used of less strength than four times this. Then  $1,303 \times 4 = 5,212$ , the least amount we ought to reckon upon. Now we have our choice either to assume a breadth or a depth. Suppose we are confined to 17 inches for the latter. Then  $\frac{5,212}{17 \times 17} = 18$  inches very nearly. If we assume 15 as our breadth, then  $\frac{5,212}{15} = 347$ , the square root, which is nearly 19 inches; so that we may have a girder 18 inches wide and 17 inches deep, or one 15 inches wide and 19 inches deep, as we please.

## NOTES AND COMMENTS.

It is to be hoped that Mr. ORCHARDSON was able to obtain veritable authority for his portrait of Madame RÉCAMIER, since French connoisseurs can see fault in the subject. In the portrait exhibition which is now open in Paris, there is one of the lady by Baron GROS—a painter who was far from being imaginative. But the adopted daughter of Madame RÉCAMIER says that GROS was never allowed an opportunity to sketch the lady, and there is no resemblance in his picture. The portraits which are trustworthy are the full-lengths by LOUIS DAVID and Baron GERARD, the three-quarter length by Madame MOREN which comes the nearest to the original, and a bust by LEHMAN. To which of them was Mr. ORCHARDSON indebted? A pencil sketch of Madame RÉCAMIER was taken after her death by M. DEVERIA, miniatures have been copied from GERARD'S canvas, CANOVA made a bust which is now at Lyons, and there are medallions by DAVID D'ANGERS and PRADIER, but the four portraits above named are the most satisfactory.

ADMISSION to the private view of the Royal Academy is so eagerly sought as an opportunity to display toilettes that ladies would be willing to pay well for the privilege. A hint might be taken from what has happened this season at the Paris Salon. Strangers were allowed to be present by payment on varnishing day, and five-and-twenty thousand francs have been obtained in this way for the benefit of the wounded at Tonkin. A much larger sum should be obtainable at Burlington House.

THE Breton menhirs and prehistoric monuments, which, according to Mr. FERGUSON, are the most remarkable group of megalithic remains, not only in France, but probably in the world, have been fairly preserved owing to their legendary interest, or rather, it may be said, from the superstitious fear of the Breton peasants. Still, there is evidence that the circles have been used as quarries. The French Government are gradually obtaining all rights of proprietorship in the remains. The dolmen and menhirs of Kermario have been lately purchased for about 18,000 francs. The stones lying on the ground have been raised, and a notice has been set up to the effect that the place is national property, and must be respected. There are, however, some parts which have not yet been acquired, owing to the extravagant value which has been set upon their interest by the inhabitants. In spite of its interest the district is rarely visited by tourists, but it has been sufficiently fascinating to retain a Scottish archaeologist, Mr. MILNE, who has devoted himself to preparing a large work on the remains, besides establishing a museum in Karnac.

AN award has been given in the arbitration case in which the Scottish Amicable Life Assurance Company sought to recover 36,000*l.* for property required by the Glasgow City and District Railway. In addition there was a claim for loss of trade in an hotel amounting to 4,000*l.*, and 400*l.* for loss arising on sale of furniture, or in all 40,400*l.* The property is situated in Dundas Street, opposite the entrance to the North British Railway Station. The area of the ground is 566 square yards, and the rental 1,313*l.* The sum awarded is about 65 per cent. of what was claimed, being 26,240*l.* for the property, 1,200*l.* for the business, and 140*l.* for the loss on furniture.

It is not often that towns which are remarkable for antiquity are found associated with modern inventions or discoveries, but this is now the position of Orbetello on the road from Leghorn to Rome. Monte Argentario, which is in the neighbourhood, is rich in ores containing a large proportion of oxide of manganese, in union with oxide of iron and a base of carbonate of lime, which are invaluable in the new processes for making steel. The mines are worked by an English firm, and are connected by a tramway with the town. Orbetello, though of great antiquity—the massive stone courses in its walls being referred to the Pelasgian period—in itself presents little of

interest. When viewed, however, from a distance, reflected in the surface of its shallow lake, often unbroken by a ripple, it forms a picturesque object in the landscape, and might well arrest the attention of the artist. To the archaeologist also the neighbourhood will repay a visit. At the point of Santa Liberata are the ruins of a villa constructed by the Emperor DIOCLETIAN, and on a promontory at the southern extremity of the lake are the remains of the more ancient town of Ancedonia. It is said that this site has never been thoroughly explored. On the shores of Monte Argentario there are two small towns—Santo Stefano to the north, and Porto Ercole on the south. Plans have lately been submitted to the Italian Minister of Public Works for a system of steam-tram lines connecting these towns with Orbetello and the station of the same name on the Roman railway.

THE French Commission of Historic Monuments have purchased for the Cluny Museum the two enamels representing CLAUDE DE LORRAINE and ANTOINETTE DE BOURBON, which formed part of the monument in the Hospital of the Holy Cross, Joinville. The price to be paid is 45,000 francs.

ANOTHER catacomb has been discovered by accident near the Via Appia Pignatelli, in Rome. It is considered to have belonged to the Israelites. This conclusion is based mainly on the appearance of palms as emblems on the walls, and according to one theory the palm was not used by the Christians until the fourth century. If the theory can be supported, this catacomb will form the third which the Jews owned within a length of one mile. The place had been visited in an earlier age, for nothing valuable was found by the workmen.

THE works for the foundations of the GAMBETTA memorial have been commenced in the Place du Carrousel, Paris, between the Pavilion Molliou and the Pavilion Turgot. But it is not to be supposed that there is any prospect of a speedy completion of the work, for the memorial is not likely to be unveiled before the *fêtes* of July 1887. The total height of the monument will be 72 feet, and of the principal group 20 feet, and it is necessary to carry up the foundations for a depth of 23 feet. The architectural part will be the work of M. L. C. BOILEAU, and M. PAUL AUBE is the sculptor. They obtained the commission in competition. GAMBETTA is represented standing erect over three wounded soldiers. On each side of the pedestal are statues of Force and Truth. The truncated pyramid against which the chief figures are posed supports the Genius of Democracy, seated on a winged lion. On one of the faces of the pedestal extracts from GAMBETTA'S speeches are to be engraved.

JEDDAH being the port of Mecca, or, in other words, the place of arrival and departure of the thousands of Mohammedan pilgrims visiting the shrines of Mecca and Medina, is a place of great importance. The advantage of sanitation has become recognised at length, and a scheme is afloat for providing Jeddah with pure water by means of pipes from a place in the hills, where water is said to be obtainable in sufficient quantity. The Governor-General having taken the matter up, local subscriptions in Jeddah have already been obtained to the amount of 3,300*l.* The total cost is estimated at 12,000*l.*, a portion of which is to be borne by the administration of the Ain Jobeida Water-works of Mecca. Little rain having fallen for three years in Jeddah, the supply in the desert tanks and cisterns outside the town was alarmingly scarce and bad, causing serious apprehensions for the future. Happily, rain fell in December in sufficient abundance to fill the cisterns and to provide two or three water supplies to the town. Should the present scheme succeed, a change for the better may probably be looked for in the normally unhealthy climate of Jeddah, which was exceptionally unwholesome during last winter, the heats continuing into January. Jeddah, however, being built upon soil containing abundance of saltish, brackish water at a depth of two or three feet, much change in its salubrity can hardly be expected.

## ILLUSTRATIONS.

THE ARTS: THE PAINTER.

THIS plate is the second of the series by M. EHLMANN.

NEW PREMISES FOR MESSRS. SHORT & CO., POPE'S HEAD ALLEY, LOMBARD STREET.

THE premises known as the City Arms, Pope's Head Alley, which we illustrate this week (formerly known as REEVES'S) have lately been taken by Messrs. SHORT & Co., wine merchants, and have now been entirely remodelled, a new front constructed in handsomely moulded wainscot, with pilasters, &c., and the walls panelled in the same material. Mr. CHARLES COX, of Hackney, was the builder engaged in executing the work, which has been carried out from designs and under the superintendence of Mr. W. HILTON NASH, A.R.I.B.A., of 5 Adelaide Place, London Bridge.

NEW DIOCESAN COLLEGE, CORK.

THE new Diocesan College, Cork, is being built on an elevated site commanding a splendid view of the city. It is very conveniently planned for its purpose. On the ground floor are arranged the chapel, school and classrooms, library, refectory and offices, &c., opening off spacious cloisters. The chapel will be very pretty, and the most ornamental part of the structure. On the first floor are arranged the professors' rooms, &c., and, on the floor over, the students' rooms.

As it was necessary to study economy in the design, the architect relied on boldness and effective grouping, more than costly details, for effect. The general facing of the building is of Bridgwater brick, relieved by white brick in arches, &c. The string-courses, cusped heads, tympana of windows, doors, &c., are of cut limestone, and the general effect of the materials is very pleasing.

The works are now far advanced, and the contractors, Messrs. E. & P. O'FLYNN, are doing their work very satisfactorily. The architect is Mr. SAMUEL F. HYNES, M.R.I.A.I., architect, South Mall, Cork.

CHRIST CHURCH, PENGE.

THIS new church is situated in the Croydon Road, Penge, and is to serve for a large and increasingly populous district, principally poor. The plan consists of a nave, with north and south aisles; chancel, also with aisles; a large vestry, or parish room, on the north side, and at the west end a narthex and tower. The whole is faced with Kentish rag and with Bath stone dressings. The extreme length of nave and chancel is 134 feet, and the width 68 feet, and when completed there will be accommodation for about one thousand persons. The architect is Mr. BASSETT-SMITH, of John Street, Adelphi, and the contractors are Messrs. GODDARD & SONS, of Farnham and Dorking. The work was commenced in June last.

The nave and aisles have just been opened for divine service, and the chancel and chancel aisles are now in progress, and will be completed in August next. The gas-fittings were supplied by Messrs. HART & Co., and the warming apparatus by Messrs. BRADLEY, of Dereham. The cost up to the present time has been about 7,000*l*.

BRYNVERN, BRECONSHIRE.

THIS proposed new residence near Newbridge-on-Wye, which forms the subject of one of our illustrations this week, is from the designs of Mr. STEPHEN W. WILLIAMS, architect and county surveyor, Rhayader, Radnorshire. The site of the proposed house is one of the most picturesque spots upon the banks of the Wye, and commands an extensive view of the river, and of the Breconshire hills.

The Brynvern estate has been lately purchased by the Rev. W. CLIFTON MOGG, who has built a bridge over the River Wye of wrought-iron lattice-girders, carried on cast-iron piers, 170 feet long, and he has also made nearly two miles of new road as an approach to the proposed mansion. The road and bridge have also been laid out and designed by Mr. STEPHEN W. WILLIAMS.

The general plan of the house is of the type of many of the old Welsh manor-houses, and is in the form of the letter H, with a central hall into which the principal reception rooms open. The style is Early Elizabethan; the walls will be built of stone from Trefnion Quarry, Breconshire, with a cavity to keep out damp, and lined with brick; the dressed stonework will be of red Alveley stone from Worcestershire, and the roof will be covered with Ruabon tiles from Mr. J. C. EDWARD'S works.

Included in the contract are stabling, coachman's house, lodge, garden wells, and a large tank to hold 5,000 gallons for the spring water supply.

## THE ARCHITECTURAL ASSOCIATION.

THE closing ordinary meeting of the Association was held on Friday evening, the 8th inst., Mr. Cole A. Adams, president, in the chair.

Mr. W. Fawcett, of Cambridge, diocesan surveyor, was elected a member of the Association by acclamation, and the following gentlemen were elected members in the usual manner:—Messrs. E. Carter, Owen Fleming, and T. Henry. The visit for Saturday (to-day), it was announced, would be made to the Tilbury Docks, Mr. Gruning, architect, and Mr. Manning, engineer.

## The Association Travelling Studentship.

The judges in this competition were Mr. Florence, Mr. Lee, and Mr. Batterbury. Out of five sets of drawings submitted, they awarded the first prize to Mr. Henry Denison Walton, and the second prize to Mr. Roland Wilmot Paul. The drawings of these two gentlemen were exhibited in the room.

The PRESIDENT stated that the sub-committee appointed at the beginning of the session to consider whether and how the efficiency of the work of the Association could be increased and consolidated, had drawn up their report, which, as soon as it was edited and printed, would be placed in the hands of the members, and that a special business meeting would be called to consider it at an early date, Friday the 29th inst. being mentioned as the day.

Mr. PERCY HUNTER then read a paper on

## Leasehold Tenure of Property, and its Prejudicial Results to London, both Socially and Architecturally.

Mr. Hunter, at the outset, referred to the causes that had led to the present extensive development of the system of occupying property on leasehold tenure for any term less than one hundred years; to the effect of this system on landowners socially; and to the results as shown in the government of the metropolis generally, the planning of London streets, and the architecture of the houses and public buildings. He alluded to the enormous growth of London, the development of railways and means of locomotion; but remarked that the chief centres of business still kept within their original and more confined limits. After going at some length into a consideration of the effects produced by the system of short tenure, he arrived at the following as the result on individual properties:—That the freeholder did not maintain his property, nor cause it to be maintained, because his interest was too remote. He only maintained his property so long as doing so maintained its marketable value and enabled him to realise his financial calculations in respect to profit rental. The occupier, who might be supposed to be the most immediately interested in the property, was prevented by the terms and conditions of his occupancy from having any interest in the property at all. There were three values in urban property—the ground rent belonging to the freeholder; the rental value obtained by the leaseholder in return for the capital laid out in erecting suitable buildings on the land; and the value of this improved property to the occupier or sub-lessee, depending in amount upon certain relative conditions of suitability of site, &c., for the purposes for which he occupies it, whether for residence or business. The influence of the system on localities was next considered, and a further proof became apparent that the trebly-divided ownership of property throughout London under the system of leasehold tenure was socially prejudicial. Speaking of its influence on architecture, Mr. Hunter said: Architecturally, London may be said to represent chaos itself. The law and order which we boast of in our civil life is absolutely wanting in the architecture of our metropolis. There is nothing expressive about it, except that of intense selfishness and utter disregard of subordination to general convenience; a reign of anarchy where every man does what is right in his own eyes, and what is wrong in the eyes of all his neighbours. In the arrangement of the streets there is no method, no evidence of design. There are awkward curves preventing the beautiful effects of distant vistas. There is an incongruous diversity in

the architectural fronts resulting from an anomalous collection of different styles; there is irregularity of outline without picturesque effect, and there being no unity, there can be no grandeur. In our streets generally, and private buildings, absence of subordination is very marked. A lofty building erected on a narrow frontage, with horizontal cornices of Classical design, opposed to all expression of altitude, but piled one above another in monotonous repetition, looks down with crushing effect upon its Gothic neighbour, whose aspiring lines, applied to a building of wide frontage, reach only half-way up the other's towering walls; while, on the further side, a blue painted, plaster-fronted tenement, used perhaps as a common coffee-house, and of whose tawdry appearance any petty provincial town might be ashamed, aggressively asserts itself, with some staring advertisement in front, while at the side its zinc chimney-pots scramble up the side of its lofty neighbour. These remarks refer to the older thoroughfares; but the worst influence of leasehold tenure is more evident in outer London, and is, of course, contemporaneous with its recent great development, for it is worth bearing in mind that, with the exception of the great Bedford, Westminster, and Portland estates, the present exclusive system of leaseholds was not fully developed until the period between 1818 and 1834, and then, with the growth of the metropolis, the system gradually affected, with ever-widening circles, the architectural face of the whole of Greater London. It may be as well, therefore, to notice here some of the distinctive effects of the system on our dwellings during the last one hundred years. On the large estates in Bloomsbury, Marylebone, and Mayfair we see the evidence of careful design in laying out of streets and squares; good planning of the houses (for the requirements of the time when they were erected) and sound buildings in their construction. In those days these qualities were insisted upon by the freeholders, who had a wise foresight as to the reversionary value of their properties, and they also satisfied the public. But there was very little endeavour to make the houses, either individually or in groups, externally pleasing to the eye by artistic treatment of their general features. Their naked and smoke-stained brick fronts in monotonous succession, destitute of all architectural decoration, from the stone-paved area below to the unaffected simplicity of the coping stones at the top, all declare with aggressive iteration that they are built to live in, not to look at. To this brick period succeeds the reign of stucco, of which Bayswater and Belgravia may be taken as typical examples. Many enormities have been committed with stucco by the unguided zeal of the speculative builder in the past, which remain to insult the eye and vitiate the taste of the present. In both these periods of brick and stucco, however, the building operations having been confined chiefly to a few great estates, there remains some evidence of general design and subordination before alluded to. But these qualities are soon lost sight of in the chaotic growth of Outer London during the last thirty years, and Local Government with its slow action and divided counsels has been unable to provide that guiding hand which is manifest on the great ducal estates. Another reason is that the freeholder himself, in addition to being a less wealthy man, and holding perhaps only one or two acres, instead of many, has, in the race for ground rents, become to a certain extent speculative too. Hence, among many adjoining owners there is but little or no unity of arrangements, while in the competition for public favour among their tenants, the leaseholding speculative builders, we get that free trade in architectural styles resulting in all those various and fearful combinations of white brick, red brick, Bath stone, stucco, slates, and tiles, according to the changing fashions of the years. But with each and every one of these it is the outward appearance that alone seems to be considered, and neither those who own, nor those who inhabit them, appear to think it worth while to pay much attention to the structural condition of the buildings. The occupier—that is, the public—to gratify his newly-developed South Kensington appreciation of the beautiful, and scorning the unaffected severity of Gower Street or Harley Street, wishes to live in the most showy-looking house at the cheapest possible rate, and tries to get a red-brick front, with moulded bricks and stone window dressings, tiled roofs and gables, ornate wood portico, tessellated entrance hall, leaded glass windows, elaborate decorations, and “every modern convenience” for a rental of something under 50*l.* a year. Can he wonder if he finds out, after a brief occupation, that such a house may be built to look at but not to live in? But there is no use in villifying the speculative builder. He is not really responsible for the sins he commits, nor has he been imposed by a wicked and tyrannical Government upon a helpless and down-trodden humanity. Both he and his works are the natural offspring of the system of leasehold tenure of property. I have not considered it necessary to go into the law of leases generally or of building contracts. Nor have I alluded, except indirectly, to the effect of leaseholds on the dwellings of the poor. This is a subject deserving of separate and special consideration, and it is beyond the scope of this paper, which deals

with the effect of leaseholds on society as a whole, and not on any particular class.

In considering whether the evils of the system could be remedied, Mr. Hunter remarked:—I have seen it gravely recommended in the *British Quarterly Review* of April 1879 that the corporate estates throughout London should be compulsorily sold with preference to the leaseholders, and the proceeds invested in the Funds. If such a recommendation were good in principle, there seems to be no special reason why its action should be limited to the property of corporate bodies only. But, whether partially or wholly carried out, the proposal is an absurd one. It would require the assistance of the imperial exchequer to perform so great a work, and it is not likely that every Englishman, Scotchman, and Irishman would wish to assist Londoners in particular to sit down under their own freehold fig-trees. If the work were done by means of local rates, the opportunities for jobbery would be infinite, while there would be no practical difference between paying a very heavy rate towards a district and paying the rental value in the ordinary way to the owner of the property. The value of the property, whatever it is, and to whomsoever it may belong, is there, and must be accounted for, or else both the State and the individual (whether freeholder or occupier) must suffer loss. Suppose, however, that by such fanciful legislation or a stroke of the pen we were able to enfranchise all leaseholds throughout London to-morrow, what would be the natural and inevitable consequence? We should simply find the day after that half the freeholders had realised the present value of their newly-acquired properties, and had sold or mortgaged them for different terms of years at their market values; and chaos would have come again. Surely, then, we must admit that it is both impolitic and impossible to deal with this difficult question in any artificial manner, and we arrive at the conclusion that the only true solution of it rests in that general appreciation of the evils arising out of the divided ownership of property under the leasehold system, which have been only partially described in this paper, and by convincing society that occupation for short terms at high rentals is, in the end, economically unsound. If these principles be true, and were generally accepted and acted upon, we might hope to obtain gradually that desideratum alluded to above—a much larger class of house-owners, in place of the present class of householders, who would, by their permanently-secured local interests, be induced to assist actively and intelligently in governing, maintaining, and improving our magnificent metropolis. The universal application of this idea to all classes alike is, however, from various causes, utterly impossible; and those who, for the sake of gaining a little present popularity, mislead people with such vain proposals, incur great responsibilities, and are certain to be defeated in time by the hard logic of results. The old saying is equally true now in the nineteenth century as it was in the days of feudalism, that “They shall get who have the capital, and they shall keep who can.”

Mr. R. G. TURNER moved a vote of thanks to Mr. Hunter for his paper. This was seconded by Mr. Brodie, and carried by acclamation.

Mr. GOTCH proposed a vote of thanks to the retiring president, Mr. Adams, which was seconded by Mr. Stannus, and carried with the greatest enthusiasm.

The scrutineers, Mr. Fawcett and Mr. Fraser, handed in the results of their counting of the voting papers, and the new list of officers for the ensuing session was read as follows:—

*President*.—Mr. R. C. Pink.

*Vice-Presidents*.—Mr. J. A. Gotch and Mr. W. H. Atkin Berry.

*Committee*.—Messrs. Cole A. Adams, F. E. Eales, F. R. Farrow, E. J. May, W. J. N. Millard, W. A. Pite, J. Slater, B.A., L. A. Stokes, A. Young, and W. H. Bidlake, M.A.

*Treasurer*.—Mr. J. D. Mathews.

*Assistant Treasurer*.—Mr. H. W. Pratt.

*Librarian*.—Mr. R. L. Cox.

*Hon. Secretaries*.—Mr. H. D. Appleton and Mr. T. E. Pryce.

*Solicitor*.—Mr. Francis Truefitt.

*Assistant Librarians*.—Mr. W. Burrell and Mr. J. Shelley Birch.

*Auditors*.—Mr. Horace Cheston and Mr. A. C. Bulmer Brooke.

*Registrar*.—Mr. T. H. Watson.

*Collector*.—Mr. Alfred Hill.

Votes of thanks were passed to the scrutineers, and to Mr. Berry, the retiring hon. secretary, and the proceedings terminated.

**The Right Hon. the Lord Mayor** has kindly consented to preside at the Second Festival Dinner in aid of the funds of the London Fever Hospital, which is to be held at Willis's Rooms on Tuesday, June 23. H.R.H. the Prince of Wales presided at the first dinner, which was held there three years ago.

## THE BRITISH ASSOCIATION.

THE arrangements for the next meeting of the British Association at Aberdeen on September 9 next have been all but completed. The last time the Association met at Aberdeen was in 1859, under the presidency of the late Prince Albert. The president-elect this year is Sir Lyon Playfair, who will take the place of Lord Rayleigh, who presided at Montreal last year. Among the vice-presidents are the Duke of Richmond, the Earl of Aberdeen, the Earl of Crawford, Lord Provost Matthews, Sir William Thomson, Dr. A. Bain (Lord Rector of the University), Principal Pirie (Vice-Chancellor of the University), and Professor W. H. Flowers. The general secretaries are, as usual, Captain Galton and Mr. A. G. Vernon-Harcourt, while Professor Bonney serves for the last time as acting-secretary. The presidents of the various sections are as follows:—A. Mathematical and Physical Science, Professor G. Chrystal. B. Chemical Science, Professor H. E. Armstrong, of the Central Technical School. C. Geology, Professor J. W. Judd. D. Biology, Professor W. C. McIntosh. E. Geography, General J. T. Walker, C.B. F. Economic Science and Statistics, Professor Henry Sidgwick. G. Mechanical Science, Mr. Benjamin Baker, M.Inst.C.E. H. Anthropology, Mr. Francis Galton, F.R.S., President of the Anthropological Institute. The lecture to working men this year will be given by Mr. Harold B. Dixon, M.A., Fellow of Trinity College, Oxford, on "The Nature of Explosives." The other lectures will be—on September 10, by Professor Grylls Adams, who is not yet able to announce his subject; and on September 14, by Mr. John Murray, director of the *Challenger* Expedition Commission, on "The Great Ocean Basins." Excursions to places of interest in the neighbourhood of Aberdeen will be made on the afternoon of Saturday, September 12, and on Thursday, September 17.

## A YEAR'S WORK OF THE BOARD OF WORKS.

THE annual report of the Finance Committee was presented to the Metropolitan Board of Works at the meeting on the 8th inst. It states that the Board has been engaged since the year 1879 in constructing in various parts of the metropolis additional large sewers by way of supplementing and relieving some of the sewers of the main drainage system which, in times of heavy rain, were found inadequate to carry off with sufficient rapidity the enormous volumes of water which found their way into them. During the year just ended the following new sewers had been completed or were in progress:—Deptford overflow sewer, completed in September last, at a cost of 33,000*l.*; new sewers from Putney to Clapham, at a cost of 151,995*l.* 19*s.*, more than half of this completed; the Eltham drainage, at a cost of 23,500*l.*; Ranelagh and King's Scholars' Pond sewers, at a cost of 96,300*l.*; Bridge Road, Hammersmith, and Stamford Brook sewers, at a cost of 8,353*l.* Various works have been done during the year to keep the buildings and machinery of the pumping stations in good order, and also other works under the Board's general contracts. Since the year 1871 the cleansing of the main and intercepting sewers (in all, about 250 miles in length) has been done by a special staff of men employed by the Board for the purpose. The cost of the work during the past year was about 14,000*l.* The allied subject of the state of the Thames and the investigation by Lord Bramwell's commission are next considered. As the summer of 1884 was unusually hot and dry, the Board found it necessary during a portion of the year to take measures for deodorising the sewage at the outfalls. The Board had set up apparatus and machinery at the Crossness pumping station, which would enable it to manufacture in sufficient quantities the compounds required for deodorising.

During the past year the Board had been engaged in acquiring the property which had to be taken for the formation of the new street from Tottenham Court Road to Charing Cross, and claims have been settled to the amount of 278,076*l.* Claims in respect of property required for the new street from Oxford Street to Piccadilly Circus, to the amount of 45,572*l.*, have been settled, and nearly all the property required has now been acquired. Of the widening of Gray's Inn Road, the greater portion of this improvement had been carried out, and the widened thoroughfare from Holborn to Clerkenwell Road was opened to traffic last April. Of the land devoted, under the Amending Act of 1882, to the erection of working-class dwellings, the first section only had been cleared. It consisted of three sites, all of which have been taken up, the total purchase money for them being 5,405*l.* for 999 years' leases at shilling rents. The Board had proceeded with a number of other improvements of a minor character in which satisfactory settlements had been made.

Parliament sanctioned fourteen improvement schemes previously to the passing of the Act of 1882, and they were

either completed or in various stages of progress. In order to test the practical working of the new Act, four new schemes were prepared, and having been confirmed by Parliament in the year 1883, were now being proceeded with; and two additional schemes had been prepared and deposited by the Board in the year just ended for the improvement of unhealthy areas in Deptford and Newington respectively.

With respect to bridges over the Thames, the report states that the foundations of the piers of Waterloo Bridge had all been deepened and secured. The Board in 1881 obtained power to build new bridges at Battersea and at Putney. The latter bridge was to be a broad and substantial structure of granite, the price agreed upon being 240,433*l.* 19*s.* Considerable progress had been made with the new bridge, and on July 12 last their Royal Highnesses the Prince and Princess of Wales visited it and laid a memorial-stone. A temporary bridge was also being built at Hammersmith at a cost of 82,177*l.* The failure of the attempt to obtain power from Parliament for providing means of transit below London Bridge is acknowledged.

The Board's expenditure during the year 1884, including 920,823*l.* advanced on loan to other local authorities, 1,602,672*l.* invested in Treasury bills, and 194,533*l.* applied to reduction of debt, had amounted to 5,373,170*l.*, of which 1,961,329*l.* had been defrayed out of money raised by the issue of Metropolitan Consolidated Stock.

## A CLERGYMAN'S VIEW OF ARCHITECTURE.

AN address was lately delivered in Wolverhampton by the rector, the Rev. J. T. Jeffcock, M.A., upon "Modern Architecture," in which he considered what should be the relation of the public towards the art. Every art, it was said, if it was to be successfully cultivated, required a public of its own. An actor must have his audience, painters and sculptors must have spectators to gaze upon their works. And in proportion as this audience and these spectators are educated in the particular art they affect, and appreciate its difficulties and triumphs and beauties, so will it be easier and more interesting and more inspiring for the artist to pursue his calling—not only creating new works, but creating them with (over and above what strikes the senses at first) hidden and interior beauties, discoverable—or at any rate appreciable—only by those who can give a cultivated attention to the subject. An advance in our appreciation of music and painting had been made by this generation; as regarded sculpture, no advance had, he feared, been made; and as regarded architecture, a certain advance, but not entirely, as that advance appeared to be retarded. Now, as members of the general public to whom the artist in architecture looks for sympathy, what, he would ask, ought to be their attitude towards architecture and the architect? In a climate like this, a house to live in, and in a free and religious country like this, a place to meet in for administrative, political, and religious purposes was of prime importance. Whether it be handsome or ugly, convenient or awkward, safe or insecure, still a building of some kind we must have, and hence it was that architecture touched us all. We all, therefore, ought to know something about it; at any rate, to know as much about it as would enable us to help the architect by telling him what we want as regards accommodation, and in being able to appreciate pretty well at its worth the good or commonplace or ugly design he may put before us. To attain this knowledge it was necessary in the first place to become acquainted with what he termed the grammar of architecture; and for the proper learning of this he recommended the study of Bloxam's "Gothic Architecture," of which no less than eleven editions had already been issued since 1841. To acquire a knowledge of architecture was something more than a catching up of the nomenclature of the art and knowing what a soffit or an architrave might mean; it was the getting of possible material forms and beautiful material forms well into the minds of the general public that was of importance. Therefore, in addition to the study of works of the kind he had named he recommended that some of the buildings illustrated in such books or mentioned in the indexes should be visited, as opportunity offered, quietly inspected and examined, and sketches or notes made of their most striking features. By thus spelling out, as it were, the grammar of architecture, by seeing what had been done, and learning what could be done with stone, brick, or wood—for each required different treatment—a man discovered not only what should be done in any new case, but had his taste trained to know also what should be avoided. It was in this way that Sir Gilbert Scott achieved his distinction. He could quote chapter and verse for all he did; could quote example and precedent for every form, every arrangement he adopted. And this it was that made him unrivalled as a restorer of old buildings; for it was in restoration that the memory comes in so strongly, and by recollecting innumerable precedents enables the architect to reproduce from very faint data—just as Professor Owen would

restore an extinct animal from a fossil bone or two—the actual design that was originally in the mind of a man long dead. Some forty years ago all architects were critics only—following precedent, and only adopting what they could quote examples for. They were spelling out the alphabet of old English forms, and piecing them together in their new buildings; they were the grammarians of architecture, and not original composers. It was otherwise now. Historical forms, old examples, ancient precedents, and fixed standards were ignored, and modern architects ventured, sometimes presumed, to “create,” and often created very abominably. For this change, from the historic to the creational treatment of English architecture, Mr. Ruskin was largely responsible. Hence the greater necessity that the public at large should be educated themselves with regard both to the first principles and the historic criticism of architecture, so as to be able to pull up short an architect whom any of them might find committing any palpable folly in any building in which they might be interested. Yet how few people had the slightest knowledge on these points. There should be thorough harmony and a clear understanding between client and architect as to the character and size of the building required, the interior accommodation, the position of doors, windows, staircases, and other details, and how the whole was to be carried out. After a few explanatory remarks as to the force of gravitation as realised in architecture, and the necessity of following out those true architectural principles in the erection of a building as would, without interfering with the beauty of the design, enable each part of it to resist this force, and at the same time add to the strength and security of the building, the President passed on to consider the æsthetic side of his subject. Architecture was concerned with beauty in every phase within its own sphere; that beauty which is perceived by the beholder when he traces delicate touches of thought impressed upon the cold unthoughtful stone, upon the insensible wood, upon the unyielding iron; the beauty, too, which he discovers in living likenesses of living forms—a leaf, a stem, a flower petrified yet still living in the marble, alabaster, or stone before him; the beauty, too, he sees in pure geometrical forms, as in the clerestory windows at Lichfield, in the picturesque outline, or in the intense variety of parts of some of our nobler English buildings, and yet amidst all this variety an underlying essential unity discernible; the diverse beauty, too, of size, regularity, and proportion, which gives to Classic architecture so much of its grace; the beauty of light and shade, the beauty of material, the beauty of colour superadded as in fresco, or stained glass, or inlaid work; the beauty of sculpture, and especially of the human form, adding itself as the noblest enrichment of a worthy building; all these were phases in which the architect might show forth, not only material beauty, but the beauty also of thought appearing through and beyond the material, and making it instinct with living language to the appreciative soul. But unless the public taste was educated to see beauty where beauty really exists, no gifted architect would dare to soar beyond the regions of commonplace utility for fear of being misunderstood by clients and losing business; or, if a beginner, he would not be lured on to the cultivation of an æsthetic sense, when he found there was no public demand for it, and that the dull surveyor sort of mind filled the pockets better than the genius which could write its poetry in stone, and brick, and wood. The President next glanced at the subject of street architecture and the desirableness of something being done in connection with the laying out of new streets, to have the houses, shops, and other buildings to be erected on each side of them constructed on some well-defined plan so as to produce one harmonious whole, instead of the incongruous grouping of different designs, different elevations, and other examples of bad taste which were too frequently to be seen in some of our principal streets and squares. Thus they would see Classic edifices well proportioned in themselves, but put most provokingly against Gothic ones with which they are in no *rapprochement*, as in the Wolverhampton Art Gallery; stucco-cased dull shops pretending to answer to ornamental brick and terra-cotta ones over the way, and these bright red ones throwing into smoky grey relief their plain ashlar stone next neighbours; high erections put where moderate ones would suit best, and low where high ones were wanted. He did not mean to contend that it was at all necessary to satisfactory effect that a whole street should be built at one time or by one architect, but surely a man who builds should consider the site and surroundings of what he is building, so that it shall not only not clash with what is there already, but harmonise or contrast pleasantly with it, and so enhance the beauty of the whole. To secure good street effect was, he feared, beyond the power of our city ædiles, though they might lay out a good curve (as in new Lichfield Street, Wolverhampton). Good grouping of houses must, he thought, be left to improved individual taste among large and small capitalists, and to such influence as the reason and enthusiasm of our architects can exercise over their patrons. In conclusion he pleaded for more attention being given by the general public to making themselves acquainted with the principles of archi-

ture; for greater sympathy between client and architect; for care in the selection of the right man to employ, according to the character and the style of the building to be erected, and then for the client to give to him careful and clearly defined instructions as to the class of building he required and the various details connected therewith

### BIRMINGHAM ARCHITECTURAL ASSOCIATION.

ON Saturday last the members of the above society paid a visit to Worcester Cathedral and city. Amongst those present were Messrs. F. B. Osborn (president), W. Hawley Lloyd, Victor Scruton (hon. sec.), W. Doubleday, O. Essex, T. W. F. Newton, F. Bailey, H. Clere, H. H. McConnal, H. Rayner, D. Arkell, J. Lavender, H. Beck, J. Goodman, &c. On the way to the cathedral the party visited Trinity Church, and inspected the fine ancient roof formerly over the Gueston Hall. On reaching the cathedral they were met by the dean (the Very Rev. Lord Alwyne Compton, D.D.) and the Rev. Canon Cattley, and were much pleased by the many interesting features that were pointed out and commented upon. Before leaving the building the members inspected the crypt, cloisters, chapter-house, bells, and obtained a fine view of the surrounding district from the top of the great tower. On descending, the party passed into the refectory, and having freely discussed its marked peculiarities, they visited the Edgar tower and other portions of the cathedral.

After a pleasant luncheon, served at the Hop Pole Hotel, the president referred to the courtesy of the dean and the kindness of Mr. W. Hawley Lloyd in supplementing his paper, given before the association in January last, by the valuable information he had now imparted. After viewing the exterior of All Saints Church, the cathedral from the river, and several old buildings, the members returned, reaching Birmingham at 6.30 P.M., having spent a most enjoyable day.

### THE SURVEYORS' INSTITUTION.

THE Council announce that the following candidates, whose names appear in alphabetical order, have passed the recent professional examinations of the Institution:—

*For the Professional Associateship.*—Arthur Joseph Edwin Arch, John Arnott, Cecil Cautley Baker, Edwin Thomas Beard, Harry Blundell, Alfred Virgoe Buckland, Herbert George Coales, Marcus E. Collins, Alfred Eiloart, William Jacob Gibbon, Robert Godfrey, Charles Henry Hebblethwaite, George Edward Hiliard, William Vincent Jull, George Arthur Lansdowne, Charles Ralph Maddox, Arthur John Martin, Frank Massie, Sydney Perks, John Rand, John Moore Sturgess, John Henry Tiffen, John Watson, jun., George Arthur Williams, and Sidney Williams.

*For the Fellowship.*—Frank Arthur Bontor, Thomas Arthur Dickson, Harold Edward Moore, James Pain, Philip Edward Pilditch, and Henry John Treadwell.

## Bygones.

“Antiquity after a time has the grace of novelty.”—HAZLITT.

### HOW BENJAMIN WEST, P.R.A., UTILISED THE ELGIN MARBLES.

THE American artist, Benjamin West, made his mark in England when, in his picture of the *Death of General Wolfe*, he represented the general, his soldiers, and the friendly Indians wearing the costumes of the time instead of Classic robes. The work was supposed to inaugurate an era of realism, and on the strength of its renown the painter became the President of the Royal Academy. But West was not disposed to abandon high art. He painted Classical subjects, and it was remarked that the designs for them which he produced in his latter years were much superior to his earlier works. The reason for the difference will be apparent from the following letter which he wrote to the Earl of Elgin. It raises the curtain of a painter's studio, and explains how inspiration is often sought, although the source is seldom so frankly acknowledged:—

My Lord,—I have to acknowledge the receipt of your lordship's obliging letter from your residence in Scotland, and have to thank you for the indulgence you afforded me to study and

draw from the sculptures by Phidias, in your lordship's house in Piccadilly.

I have found in the collection of sculpture so much excellence in art (which is as applicable to painting and architecture as to sculpture), and a variety so magnificent and boundless, that every branch of science connected with the fine arts cannot fail to acquire something from this collection. Your lordship, by bringing these treasures of the first and best age of sculpture and architecture into London, has founded a new Athens for the emulation and example of the British student. Esteeming this collection as I do, my lord, I flatter myself it will not be unacceptable for your lordship to know what are the studies I have made from it.

I must premise to your lordship that I considered loose and detached sketches from these reliques of little use to me, or value to the arts in general. To improve myself, therefore, and to contribute to the improvement of others, I have deemed it more important to select and combine whatever was most excellent from them into subject and composition.

From the Centaurs in *alto rilievo* I have taken the figures of most distinguished eminence, and formed them into groups for painting; from which selection, by adding female figures of my own, I have composed the *Battle of the Centaurs*. I have drawn the figures the size of the originals, on a canvas 5 feet 6 inches high by 10 feet long.

From the equestrian figures in *relievo* I have formed the composition of *Theseus and Heracles in Triumph over the Amazons*, having made their Queen Hippolita a prisoner. In continuation, and as a companion to this subject, I have formed a composition in which Hercules bestows Hippolita in marriage upon Theseus. Those two are on the same size with the Centaurs.

From the large figure of Theseus I have drawn a figure of that hero of the same size with the sculpture. Before him, on the ground, I have laid the dead body of the Minotaur which he slew. As by this enterprise he was extricated from the labyrinth by the aid of Ariadne, I have represented that princess sitting by his side gazing on him with affection. In the background are the Athenian youths whom he delivered from bondage, and near them the ship "with black sails" (in the poetic fancy of Pindar) which brought him to Crete. The size of this canvas is 6 feet high by 9 feet long.

From the figure of Neptune I have formed a companion to the Theseus. In this composition I have shown Neptune reclining with his left arm upon the knees of Amphitrite, while with his right he strikes the earth with his trident, and creates the horse. Around him is Triton with his train of marine gods; in the background are equestrian exhibitions, and in the distance ships at anchor.

From the casts in plaster of Paris taken from the moulds which your lordship had made at Athens, I selected such figures as I was enabled to form into a composition, the subject of which is *Alexander and his horse Bucephalus*: it is on a canvas smaller than those before-mentioned.

In order to render the subjects which I selected with perspicuity, and the effect which arises from combined parts and the order of arrangements comprehensive, I have ventured to unite figures of my own invention with those of Phidias; but as I have endeavoured to preserve with the best force of my abilities the style of Phidias, I flatter myself the union will not be deemed incongruous or presumptuous. Your lordship may perhaps be inclined to think with me that a point, and, if I may so express it, a kind of climax is thus given to those works by the union of those detached figures with the incorporation of the parts of individual grandeur and abstracted excellence of Phidias. For what I have done, my lord, I had the example of Raphael and most of the Italian masters of the greatest celebrity. Is it not, moreover, this combination of parts which comes the nearest to perfection in refined and ideal art? For, thus combining what is excellent in art with what possesses character in nature, the most distinguished works have been produced in painting, poetry, and sculpture.

In following this system of combination I had the singular good fortune, by your lordship's liberality, to select from the first productions of sculpture which ever adorned the world in that department in art, which neither Raphael nor any of the distinguished masters had the advantage to see, much less to study since the revival of art. I may therefore declare with truth, my lord, that I am the first in modern times who have enjoyed the much-coveted opportunity, and availed myself of the rare advantage of forming compositions from them by adapting their excellences to poetic fictions and historical facts.

**The Financial Board of Cambridge University** propose to borrow 70,000*l.* for the new buildings, of which the estimated cost is as follows:—Chemical laboratory, 30,000*l.*; Sedgwick Museum, 12,000*l.*; for physiological department, 10,000*l.*; and anatomy and medical school, 10,000*l.* Additional buildings will also be required for the library as well as other literary departments.

#### The Ashpitel Prize.

SIR,—At the Institute meeting held on the 4th inst., Professor Kerr asked "why the Ashpitel prize had been withheld from the best of the seventeen candidates who had passed the examination for Associateship during 1884?" Mr. Arthur Cates, in replying, "expressed regret that the Council for two years had been unable to recommend any candidate as worthy of being honoured by this distinction—a distinction which, if lightly given, would discredit the prize itself. It is the most distinguished honour which any candidate can receive; it is an honourable distinction which should not be lightly thought of, but should be secured by a recipient worthy of the honour of being designated in the list of members as Ashpitel prizeman."

This prize was instituted about 1873, and it has only been awarded four times in these twelve years, viz., in 1873 to Hugh Stannus; in 1877 to F. T. Baggallay; in 1879 to Bruce John Capel, and in 1882 to Thomas Purves Marwick.

The prize has now assumed considerable importance. It is given to the candidate "who, in the opinion of the Council, most highly distinguishes himself in the examinations for the degree of Associate held during each year." It is thus the most important prize in the gift of the Council. The examination for the Associate degree embraces all the branches of an architect's training, and it follows that the man who all over is the most distinguished Associate of his year attains a highly honourable position, and one not easily gained.

For this high honour the Council award a prize of books valued at 10*l.*, while for essay-writing they give a medal and 25*l.*, for design a medallion and 50*l.*, and for sketching a medal and 40*l.* Medals are given with nearly all the prizes in the gift of the Institute—the Soane, Grissell, Pugin, and Godwin prizes, as well as those for essays and measured drawings.

I venture to affirm that the medal is the most popular form of award, and I would suggest to the Council the propriety of adding a medal to the Ashpitel prize. I am perfectly sure that candidates going up for examination would prepare themselves thoroughly to compete for this distinction. At present they give the minimum study in order to pass. Give an object to strive for in the shape of a good prize, accompanied by a tangible record, like a medal—which one can show—and you will not only give a zest to those preparing for examination, but you will increase the number of candidates for the degree. The cost would be trifling, and I don't think that on another occasion Mr. Cates would have reason to complain at the lack of worthy candidates.—I am, sir, &c.,

A. B. C.

London: May 7, 1885.

#### LEGAL.

##### Carlisle County Court, May 5.

(Before Mr. INGHAM, Judge.)

OLIVER *v.* JOHNSON.—ARCHITECTS' FEES.

In this case Mr. G. D. Oliver, architect, sued Mr. Thomas Johnson, solicitor, Bank Street, for a sum of 7*l.* 7*s.* for professional services. The plaintiff said the account was incurred in the valuation of some property in Rickergate and Peter Street, belonging to Mr. Dennis McCauley, innkeeper. Mr. Errington, for the defence, said the order had come from Mr. McCauley, and the work was done for him. The plaintiff stated that his original charge for the appraisement of the property was 18*l.* 15*s.*, but when he applied to the defendant for payment he was told by him that he had never got a farthing from Mr. McCauley, and, as his (the defendant's) fees would have to come out of his own pocket, Mr. Oliver consented to reduce his account to 7*l.* 7*s.* He was told by Mr. Johnson to value the property, as he wanted to send the valuation to a client in Cockermouth. He admitted that Mrs. McCauley had first seen him on the subject, and had told him to go and see Mr. Johnson about it.—His Honour: This is Mrs. McCauley ordering you.—Mr. Oliver stated that he sent in his bill to Mr. Johnson on October 13, 1883, and Mr. Errington pointed out that Mr. McCauley had become bankrupt in September of that year, adding that his defence was this—that the defendant was acting as agent for a disclosed principal, and was merely instructed as an agent.—His Honour: This Court happens to know that Mrs. McCauley is a very important individual. I have always been inclined to look upon Mrs. McCauley as Mr. McCauley. She has done all sorts of things relating to business matters, signed cheques, &c.—Mrs. McCauley was then sent for, and at a later stage she appeared in Court, but her evidence was not taken, the defendant himself going into the witness-box, and stating that Mr. and Mrs. McCauley had three mortgages on

the property, and they came to him and asked him if he could consolidate these mortgages. He thought he could through a client in Cockermouth; but, as a first step, it was necessary to have the property valued, and he recommended to them for this purpose Mr. Oliver. He himself never gave Mr. Oliver orders to do it, but he was not aware whether it was Mr. or Mrs. McCauley who had given instructions.—His Honour, addressing the plaintiff, said he was afraid there was a very slight prospect of his getting paid by anybody. He understood that there was no dividend on the estate.—In cross-examination, the defendant stated that he had had several letters from Mr. Oliver about the account, but never took any notice of them, as he did not consider that he was liable.—His Honour directed that judgment should be entered for defendant, without costs.—Mr. Errington: Perhaps your Honour will strike out the case, and save plaintiff the hearing fees.—His Honour: I cannot do that.

### CHURCH BUILDING AND RESTORATION.

**Acaster Malbis.**—A portion of the restoration of the parish church has been carried out under the direction of Mr. C. Hodgson Fowler, of Durham. Funds are being raised to complete the work of restoration.

**Langley.**—This church has been reopened after restoration. The work has been carried out by Messrs. Bardell Bros., of King's Lynn, under the direction of Mr. Ewan Christian.

**Rettendon.**—A Congregational mission chapel has been opened. The building has been erected by Mr. F. Johnson, of New Street, Chelmsford, from the designs of Mr. Charles Pertwee, architect, of Chelmsford.

**Durham.**—The contract for the new Congregational church has been let to Messrs. Geo. Gradon & Son, of that city, for 3,480*l.*, and the works are now in progress. The foundation-stone is to be laid by Sir Farrer Herschell, Q.C., M.P., Solicitor-General, on the 3rd of next month. The whole of the works will be carried out from the designs and under the superintendence of Mr. H. T. Gradon, architect, of Durham.

**St. Paul's Church, Stockton-on-Tees.**—This church was consecrated last Monday. It is in the Early English style, and is designed with nave and aisles, chancel, organ chamber, and two vestries, and has a bell gable at the west end. The walls are faced inside and out with buff-coloured bricks, relieved by bands and quoins of red brick, and having the dressings round windows and doors of white stone. The whole of the wood work is of pitch pine. The chancel and gangways are paved with mosaic tiles. The windows are glazed with cathedral-tinted glass, having borders of rich tints and bands of roundels. The accommodation is for about 450 adults, and the cost is about 2,800*l.* The architect is Mr. J. P. Pritchett, of Darlington.

**Tunstall.**—Christ Church, Tunstall, has been reopened after enlargement. The work has been carried out in two contracts, the second being a restoration of the old fabric. The extension consists of a chancel, two transepts, a side chapel, and vestry with parish room over. The nave has been extended eastward about 8 feet. The work has been executed from the plans of Mr. A. R. Wood, architect, Tunstall. The first contract was taken by Mr. John Proctor, of Tunstall, at 2,200*l.*, and the contract for the restoration of the old portion by Mr. Charles Smith, of Tunstall, the amount being 800*l.* The stonework is by Mr. T. Ford, jun., Tunstall. Messrs. Jones & Willis supplied the ironwork and lectern, Mr. Buckley, of Goldenhill, the communion-table, and Messrs. Williams, of London, executed the glazing.

**Sulgrave.**—The parish church has been reopened after restoration, which has been carried out from the plans of Mr. J. Piers St. Aubyn, of the Temple, London, by Messrs. Isaac Wootton and Richard Taylor, of Sulgrave. The cost of the work has been about 1,910*l.*, and the church will now seat 250 persons.

**Pocklington.**—The porch of the old church of Pocklington has been restored, from the designs of Mr. Smith Brodrick, of Hull, by Mr. T. Grant, builder, of Pocklington. Amidst the timbers of the old porch were discovered a raven's nest containing a number of coins, several of them being monastic tokens.

### SCHOOL BUILDINGS.

**Birmingham.**—The foundation-stone of an extensive addition to the Wycliffe Sunday School, St. Luke's Road, has been laid. The architects are Messrs. Ingall & Hughes, and the builder Mr. Thomas Rowbottom. It is estimated that the cost of the buildings, with fittings, &c., will be about 2,000*l.*

**Huddersfield.**—The Huddersfield Board School at Oakes, Lindley, is being extended by the erection of an extra department for 350 children, and a room for teaching cookery to fifty girls, together with a covered playground. The works are

being carried out from plans and designs by Mr. Benjamin Stocks, architect, Huddersfield, at a cost of 4,600*l.*, exclusive of fittings.

**Stafford.**—The foundation-stone of the Eastgate Schools, Stafford, has been laid. The school buildings, which when completed will accommodate 226 children, consist of a school-room, 78 feet by 19 feet; class-room, 20 feet by 16 feet 6 inches; hat and cloak-room; and separate entrances for each sex and the necessary offices. An apsidal chancel will also be provided in case the buildings should at any time be used for religious services. The style of architecture adopted is Gothic; the walls will be of red brick with white Alton stone dressings, and the roofs will be covered with Broseley tiles. The contractor is Mr. F. Espley, and the architect Mr. Robert Griffiths, of Stafford.

### NEW BUILDINGS.

**Manchester.**—The memorial-stones of a Methodist central hall have been laid. The cost of the buildings is estimated at something over 20,000*l.* The architects are Messrs. Woodhouse & Morley, of Bolton and Bradford.

**Harrogate.**—The new premises in James Street for the Bradford Old Banking Company consist of a central block, to be used for bank business purposes and manager's residence, with wings on each side for general business premises and residences in connection. The architects are Messrs. H. E. & A. Bown, of Harrogate; the contractors are Messrs. Longley Bros., of Leeds; Mr. Fletcher, of Manchester, clerk of works. The strong room and strong vault are fitted with Chubb's fire and burglar-proof steel doors and grids.

**Worcester.**—A costly and elaborate clock tower, erected by Mr. Jones in his grounds at Abberley Hall, has been opened. It is in the Early English style; is 161 feet in height, 25 feet square, tapering to 23 feet above the plinth, which is 99 feet from the ground. The wall is of the local grey sandstone, quarried on the estate, relieved with Alveley red sandstone and yellow oolite from Ham Hill, near Yeovil. On the fourth of the nine stages is an oriel chamber, from which a fine view of the country for many miles round is obtained. The clock was furnished by Mr. Joyce, and the bells by Messrs. Taylor Bros., of Loughborough. Mr. J. P. St. Aubyn is the architect.

### GENERAL.

**The Marquis of Lorne** will open the summer exhibition of the Yorkshire Fine Art Institution on June 11.

**Mr. G. C. Ashlin, A.R.H.A.,** has offered a prize of 10*l.* for the best statue in Caen stone suitable for an altar which will be shown in the Irish Artisans' Exhibition. The Royal Institute of Architects (Ireland) have announced an intention of making a grant towards the prizes.

**M. Bouguereau** has been elected president of the French Association of Artists in succession to the late M. Sommerard. He received 45 votes; M. Roger-Ballu obtained 42.

**The Members** of the Sketching Club of the Leeds and Yorkshire Architectural Society commenced the summer session with a visit to Selby on Saturday, where, under the guidance of Mr. T. S. Ullathorn, they had a very pleasant ramble over the old Abbey Church. A few interesting sketches were made by the members. Messrs. F. W. Bedford, J. Dixon, J. H. Greaves, F. Haigh, J. Hall, W. Hill, C. B. Howdill, C. G. Page, J. W. Twist, T. S. Ullathorn, and A. Whitehead (hon. sec.) were of the party.

**A Bazaar** has just been held at Stourbridge in aid of the fund for building a spire to Lye Church.

**A Bazaar** was opened at Poplar on Monday by H.R.H. Princess Christian, in order to raise funds for the erection of the new Mission House in Giraud Street, which is to be erected from the designs of Mr. B. A. Elphicke, of London and Tunbridge Wells.

**The Paisley Town Council** on Tuesday last agreed to rescind the motion for the erection of municipal buildings in High Street and St. Morren Street.

**A British Textile Institute**, on the model of the Iron and Steel Institute, is about to be formed, and a committee appointed to consider a scheme has drawn up a constitution and code of rules. Applications for Fellowships can be obtained on application to Mr. Ashenhurst, Technical College, Bradford.

**Designers** for all classes of needlepoint lace, cut cambric, and linen crochet work, &c., are invited to compete for prizes, amounting in value to 73*l.* 10*s.*, which are offered with a view of obtaining designs which may be distributed to and executed by Irish lace makers. Designs must be submitted for competition on or before July 15, 1885. They should be addressed to Mr. Alan S. Cole, Hon. Treasurer Irish Lace Prize Fund, South Kensington Museum, of whom all information may be obtained.

A Business Supplement

# The Contract Reporter.

to The Architect.

LONDON, MAY 16, 1885.

## TRADE NOTES.

A MUNICH window, representing Charity, has just been erected in the south transept of St. Peter's Church, Cranley Gardens, Kensington, the gift of Mr. C. Dalrymple, M.P., the inscription at the foot recording the fact that it has been placed "To the memory of Alice Mary Dalrymple, September 2, 1884." The work is by Mayer & Co.

MESSRS. CARTER & Co., of the Encaustic Tile Works, Poole, Dorset, have lately completed a hand-painted tile panel, representing a scene from Shakespeare's life, with majolica dado and mouldings, and also a marble mosaic floor to the entrance lobby of the premises of the Blackfriars Distillery Company, in Blackfriars Road. The scene, as depicted in the panel, shows Shakespeare and Ben Jonson in the old Blackfriars Inn, and it has consequently a local appropriateness. It is a very effective piece of decoration, and we understand the firm are extending this particular branch of their business. Shakespeare and Ben Jonson are engaged apparently in a deeply interesting argument, or in one of their wit combats, which fascinated their hearers. The youthful sportsman and the damsels are grouped about in respectful silence, awed by the brilliant words which probably were often beyond their comprehension. Additional solemnity is imparted to the scene by the presence of a friar, who also displays his interest in the conversation. Mine host is a perfect representation of the jovial landlord as he approaches his guests with flagon and tankards. The framing of the panel and dado is also good and effective, and Messrs. Carter & Co. are to be commended for having gone somewhat out of the beaten track, and succeeded so well.

STEVEN BROS. & Co., architectural, sanitary, and general ironfounders, 35 and 36 Upper Thames Street, E.C., have now secured the lease of new and extensive premises at No. 4 Upper Thames Street, London, E.C., opposite the *Times* office, Queen Victoria Street, E.C., and after they complete their extensive alterations, will be able to have on show the largest stock in London of hot-water baths and fittings, ranges, slow-combustion stoves, marble chimney-pieces, marble kerbs, tiles and tile hearths, stable fittings, ornamental gates, railings, verandahs, &c., &c. Owing to the large and ever-increasing demand for their superior manufactures, this well-known firm has made such rapid strides in the iron trade, that it has become absolutely necessary for them to remove their enormous stock to warehouses where it may be seen to better advantage than has hitherto been the case, owing to want of space at their present address.

BLUNDELL'S PETRIFYING LIQUID.—Amongst the preparations now before us for preventing damp from making its appearance on interior walls, that of Messrs. Blundell, Spence & Co. holds a high position. Its powers of resisting damp are remarkable, and, unlike most of these preparations, it is made in two colours, white and red, is applied as easily as paint, and dries with a glazed surface. From this standpoint

it may fairly take the place of glazed bricks, and at a considerable less cost, while it offers little chance for the accumulation of dirt, the enamelled surface enabling it to be washed whenever necessary. It can be applied with equally good effect to metal, wood, cement, brick, &c., and its cost is but trifling. There should be no difficulty in obtaining the preparation, as from the extensive ramifications of the firm the majority of dealers in paints and varnishes keep it in stock.

MESSRS. WM. WOOLLAMS & Co., manufacturing paperstainers, of 110 High Street, near Manchester Square, W., original makers of non-arsenic papers, exhibit at the Furniture Trades Exhibition a variety of artistic wall and ceiling papers, all free from arsenic; *inter alia*, the "Rialto," a large Italian damask pattern, designed by Miss Louisa Aumonier; the "Fig," an Italian brocade pattern in six different coloured flocks, on brocaded gold ground, by A. Silver; the "Nuremberg," a German Renaissance design, drawn by E. Wildey, from an old example; the "Leywid," an original design by the same artist, in red flock, both these being extra widths and lengths; the "Umbria," an early Italian design, drawn by G. C. Haité; the "Savoy," dado decoration, Adams' style, designed by A. F. Brophy; the "Floral Ethics," dado decoration, conventional flowers, &c., designed by C. F. A. Voysey; the "Milo," Italian damask, extra width and length, designed by Miss L. Aumonier; in yellow flock and in terra-cotta; the "Widford" decoration, designed by O. K. Rickatson, with panelled dado; the "Night Blooming Cereus," dado decoration, designed by C. F. A. Voysey; the "Rush," dado decoration, designed by Owen W. Davis and Reuben Bennett; the "Turin," dado decoration, designed by G. C. Haité; the "Siri," Japanese chintz pattern, designed by F. J. Weidemann; and the "Padua," an Italian all over filling with border and dado, designed by H. Noble, the frieze by Miss Louisa Aumonier. The foregoing are the chief wall-papers shown so far as the space occupied by each is concerned, but there are also numerous examples of raised flocks on coloured grounds, patent embossed flocks in relief, with designs richly modelled in coloured flocks, finished without painting over, and a large and varied collection of patterns in books and on stands, the latter including the private designs of Mr. J. Adam Heaton, for whom Messrs. Wm. Woollams & Co. are trade agents and printers. Messrs. Wm. Woollams & Co. invite special attention to the specimens of "Tergorine," a new material patented, now exhibited for the first time, which they have the sole right to apply to wall-hangings. It is embossed in various patterns in imitation of stamped leather, and examples are shown decorated in a variety of styles mostly washable. It takes and retains an admirable impression; it is entirely different in its artistic effect from any other material hitherto employed for similar purposes, and is quite free from any objectionable odour, while it is exceedingly tough and believed to be as durable as real leather, of which it is largely composed.

## COMPETITIONS OPEN.

BLACKPOOL.—May 20.—Applications are invited for the Office of Borough Surveyor. Salary 300*l.* per annum. Mr. T. Loftos, Town Clerk, Blackpool.

NORWICH.—May 20.—Applications are required for the Appointment of a City Surveyor. Salary 200*l.* per annum. Mr. H. B. Miller, Town Clerk, Norwich.

SHEERNESS.—May 20.—Applications are required for the Appointment of a Surveyor. Mr. Vincent H. Stallon, Trinity Road, Sheerness.

WEDNESBURY.—May 21.—Applications are required for the Appointment of a Town Surveyor. Salary 200*l.* per annum. Mr. J. Smith, Local Board Offices, Wednesbury.

## CONTRACTS OPEN.

ABERDEEN.—May 19.—For Building House at Pardes Daviot. Messrs. Jenkins & Marr, Architects, 16 Bridge Street, Aberdeen.

ABERDOUR.—May 21.—For Additions to Orphanage. Mr. Alex. Ross, Architect, Inverness.

ABERLOUR.—May 16.—For Additions to Beurnes Distillery, Aberlour. The Manager.

ALNWICK.—May 21.—For Additions and Alterations. Mr. C. E. Moore, *Gazette* Office, Alnwick.

ALNWICK.—May 23.—For Building Bridge over Tyelaw Burn. Mr. C. Percy, Clerk to the Highway Board, Alnwick.

ALVES.—May 19.—For Alterations and Repairs to Farm Buildings. Messrs. A. & W. Reid, Architects, Elgin.

ARMLEY.—May 16.—For Building Two Dwelling-houses, Stabling, &c. Mr. Henry Marsden, Architect, 365 Sticker Lane, Bradford.

AUGHNACLOY.—May 20.—For Repewing, &c., Parish Church. Mr. R. J. Betty, Aughnacloy co. Tyrone.

BANDON.—June 8.—For Construction of Water Works. Mr. James Price, C.E., 44 Harcourt Street, Dublin.

BARNET.—May 23.—For Construction of Road (1,650 feet) with Kerb. Messrs. W. & F. Houghton, Surveyors, 61 Old Broad Street, E.C.

BASSENTHWAITE.—May 18.—For Alterations and Additions to Farm Buildings. Messrs. J. M. Richardson & Sons, 18 Bank Street, Carlisle.

BRISTAL.—May 21.—For Building Large Wesleyan Schools. Mr. Walter Hanstock, A.R.I.B.A., Branch Road, Batley.

BOOTLE.—May 19.—For Building Additional Offices, &c., Stone Piers, Chains, and Brick Walls in connection with Town Hall. Mr. J. Alexander, Borough Surveyor, Town Hall, Bootle-cum-Linacre.

BRADFORD.—May 20.—For Building Board School, Thornton Lane. Mr. C. H. Hargreaves, Architect, Bank Street, Bradford.

BRENTWOOD.—May 16.—For Building Cottage at Carnsland. Mr. F. Whitmore, Architect, 22 Duke Street, Chelmsford.

**BRIGHOUSE.**—May 21.—For Laying Brick Sewer. Mr. G. Hepworth, Surveyor to the Local Board, Bradford Road, Brighouse.

**BUNDORAN.**—May 20.—For Excavation of Channel in Rock (400 feet), Construction of Boat Slip and Platform, Landing Quay (165 feet), and Inclined Approach. Plans, &c., at the Office of Public Works, Dublin.

**BURTON-ON-TRENT.**—May 22.—For Enlargement of County Court. Mr. A. B. Mitford, H.M. Office of Works, 12 Whitehall Place, S.W.

**CASTLE DONINGTON.**—For Building Villa. Mr. H. Sulley, Architect, Wheelergate, Nottingham.

**CHEDDLETON.**—May 18.—For Additions and Alterations to Churnet Grange. Messrs. W. Sugden & Son, Architects, Leek.

**CHIGWELL.**—May 19.—For Building Boys' School and Master's House. Mr. Edmond Egan, Architect, Loughton, Essex.

**CHRISTCHURCH.**—May 28.—For Building Schools for the Guardians of the Poor. Mr. Edgar H. Burton, Architect, Bournemouth.

**CLAYTON.**—May 21.—For Building Villa Residence, Stabling, Out-offices, &c. Mr. J. Drake, Architect, Winterbank, Queensbury.

**COLCHESTER.**—May 21.—For Building House in North Street. Mr. W. Scargill, Architect, 31 North Street, Colchester.

**COLCHESTER.**—May 19.—For Flooring and Bookcases at Museum and Castle. Mr. Charles Clegg, Borough Surveyor, Stanwell Street, Colchester.

**COLNE AND MARSDEN.**—May 25.—For Forming Brick Barrel Sewer; Building Piers, to carry a wrought-iron Trough; the Raising of an Occupation Road; Laying Iron and Earthenware Pipes, 960 yards. Mr. Henry Bancroft, C.E., 83 Mosley Street, Manchester.

**CORNWALL.**—May 19.—For Construction of the Chasewater and Blackwater Railway Viaducts. The Engineer, Paddington Station.

**DARTFORD.**—May 23.—For Building Machinery House for Electric Lighting of Hospital Ships at Long Reach. Messrs. H. Jarvis & Son, Architects, 29 Trinity Square, S.E.

**CROYDON.**—May 19.—For Re-slating, Repairing, and Painting Slaughter-houses. The Borough Engineer, 8 Katherine Street, Croydon.

**DERBY.**—May 18.—For Building Prison Officers' Quarters. Mr. Thomas Coulthurst, Borough Engineer, Municipal Offices, Babington Lane, Derby.

**DERBY.**—May 16.—For Building Nineteen Cottages. Mr. Lawrence Bright, Architect, 9 St. Peter's Church Walk, Nottingham.

**DONCASTER.**—May 20.—For Additions and Alterations to the Yorkshire Bank. Messrs. Wilson & Masters, Architects, Hartshead Chambers, Sheffield.

**DONCASTER.**—May 29.—For Alterations and Additions to Congregational Church. Mr. C. J. Innocent, Architect, 17 George Street, Sheffield.

**DUNNERDALE.**—For Additions to Ball Hall. Messrs. Settle & Farmer, Architects, Ulverston.

**EDROM.**—For Additions and Repairs to Parish Church. Messrs. Hardy & Wight, Architects, 7 St. Andrew Square, Edinburgh.

**FLOOKBURGH.**—May 20.—For Building Farm-house. Mr. Joseph Greenwood, Rosthwaite, Cark, Carnforth.

**FOLKESTONE.**—May 22.—For Building Wesleyan Methodist School for Girls. Messrs. Ruck, Son & Smith, Architects, Maidstone.

**HALIFAX.**—May 21.—For Building Shops at Cross Hills. Messrs. Jackson & Fox, Architects, 22 George Street, Halifax.

**HALIFAX.**—May 23.—For Building Villa, Coach-house, Stables, &c. Mr. Chas. F. L. Horsfall, Architect, Lord Street Chambers, Halifax.

**HANLEY.**—For Building Villa Residence at Birches Head. Mr. G. W. Bradford, Architect, Miles Bank Chambers, Hanley.

**HARROGATE.**—May 20.—For Building Club, Victoria Park. Messrs. H. E. & A. Bown, Architects, James Street, Harrogate.

**HELME.**—May 28.—For Building Residence, Stable, Coach-house, &c. Messrs. John Kirk & Son, Architects, Huddersfield.

**HEREFORD.**—May 26.—For Additions, Clergy Vicarage, near Hereford. Messrs. Nicholson & Son, Architects, Hereford.

**HOLBORN.**—May 19.—For Building Board-room and Offices, Dispensary, and Relief Offices, Clerkenwell Road. Messrs. H. Saxon Snell & Son, Architects, 22 Southampton Buildings, W.C.

**JARROW.**—May 16.—For Building Premises and Houses. Mr. J. Walter Hanson, Architect, South Shields and Jarrow-on-Tyne.

**KEIGHLEY.**—For Supply and Erection of Six Purifiers with Valves, Connections, &c., together with Buildings for same. Mr. J. Laycock, Engineer, Municipal Offices, Keighley.

**KEIGHLEY.**—May 21.—For Building School Classrooms, &c., and Additions to Baptist Chapel at Sutton. Messrs. Petty & Ives, Architects, Waterhouse Street, Halifax.

**KILKEEL.**—May 20.—For Extension of Pier (200 feet), Altering Walls, Enlarging Basin, Construction of Wharfs, Boat Slips, Groins, &c. Mr. W. B. Soady, Secretary, Office of Public Works, Dublin.

**KINGSWEAR.**—May 20.—For Building Caretaker's House, Mortuary, &c., at Burial Ground. Mr. E. Appleton, Architect, 1 Vaughan Parade, Torquay.

**KNIGHTON.**—May 20.—For Erection of Workhouse Buildings. Mr. Edwin H. Deacon, Clerk to the Guardians, Knighton, Radnorshire.

**LEAMINGTON.**—May 18.—For Repairs and Alterations to Dormer Villa. Mr. F. Foster, Architect to the School Board, Euston Place, Leamington.

**LEAMINGTON.**—May 23.—For Building St. Nicholas Parish Rooms and Sunday Schools. Mr. J. Cundall, Architect, 90 The Parade, Leamington.

**LEEDS.**—May 19.—For Supply of Untrapped Earthenware Gulleys. The Town Clerk, Leeds.

**LEEDS.**—For Iron Railing, Urinals, and Dwarf Wall for Cattle Market. The Borough Engineer, Municipal Buildings, Leeds.

**LISBURN.**—May 22.—For Construction of Gasholder Tank. Mr. John McClure, Secretary, Lisburn.

**LLANELLY.**—May 18.—For Building Infant School, &c, at Lakefield. Mr. E. H. Lingner Barker, Architect, 6 King Street, Hereford.

Established 1820.]

INTERNATIONAL HEALTH

3 Silver and 4 Bronze Medals

[Telephone No. 3,525.  
EXHIBITION, 1884.

Awarded for Sanitary Appliances.

HENRY CONOLLY.

LIMITED,  
MANUFACTURING SANITARY ENGINEERS,

Call the attention of Architects, Surveyors, and Builders to their Closets, the advantages of which will be readily seen by the accompanying Illustration.

THE "SAFETY" VALVE WATER-CLOSET

WITH

Conolly's Reversible Trap (Patent No. 3,754).

This drawing illustrates an improvement in the trap of a Closet, which admits of the outlet being placed in any position to suit the soil-pipe. This object is attained by means of a collar, which is similar in shape to that of an ordinary Valve-Closet. The base of the collar being round is flanged A; this is attached to a corresponding flange B, formed on the end of Trap by means of screw bolts, and from the drawing it will be seen that the outlet can be fixed in any position. It is obvious that this system can be adopted in every case where a separate Trap is employed.

The "Safety" Valve Water-Closet, like the "Nestor" as regards the Basin, is made with a cast iron trap above the floor line. The Trap is constructed so that the water-line is within 1½ in. of the seating of the Closet; therefore it will be seen if there become any defect in the india-rubber seating, the trap still remains sealed; by this means the necessity of a ventilating pipe is also dispensed with, also the system of having a weepin pipe from the supply to the Lead Trap fixed in the box of Closet, thereby being no space for the generation of gases. The overflow arm is also protected from the possibility of soil corroding the edge of pipe, as the clack is made to open against it.

CAN BE SEEN IN ACTION IN NEW SANITARY SHOW-ROOM

53 & 55 Hampstead Road, 169 & 171 Drummond Street

## VENETIAN ENAMEL MOSAIC FOR MURAL DECORATION.

Mosaic Works conducted on the same principle as in Venice and Rome by

**A. CAPPELLO,**

472 KING'S ROAD, CHELSEA, LONDON, S.W.

Established in 1880.

15 YEARS IN ENGLAND WITH DR. SALVIATI.

The above Factory is established in London for the purpose of making the Venetian Enamel Mosaic Work an English trade, and to reduce the cost to half the price that has been hitherto charged abroad or by the London agents.

See "Building News," Oct. 12, 1883, in reference to the Mosaic Pictures for the new Church of the Brompton Oratory, executed by this Establishment.

Gold Enamel Mosaic Work at 15s. per sq. ft.  
Venetian Enamel Mosaic Figure Work at 20s. per sq. ft., including expenses of Fixing.

## MOSAIC PAVEMENTS.

TO  
**ARCHITECTS, BUILDERS,  
AND  
CONTRACTORS.**

## STEEL CUT NAILS!!

The modern and important discovery in the process of making Steel has so reduced the price, that Steel Cut Nails of the well-known "Mitre Brand" can now be supplied at only 1s. 6d. per cwt. more than the price of the ordinary Common Iron Cut Nails.

The Steel Cut Nails are far superior in quality and more uniform in size than any wrought or hand-made Nails yet produced, and being lighter in weight than ordinary Iron Cut Nails and free from wasters, they are found cheaper in actual use than common Iron Cut Nails at 1s. 6d. per cwt. less.

These Steel Cut Nails are specially suited for Builders, Joiners, Copers, Packing-Case Makers, &c., and a single trial is sufficient to convince any one of their superior quality and cheapness.

**PATENT WROUGHT STEEL NAILS.  
OVAL WIRE NAILS.**

AS SUPPLIED TO 600 PUBLIC HEALTH BODIES.

The Sanitas Co., Limited, Bethnal Green, E.

GRUNDY'S PATENT  
WARM-AIR  
VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.

## TESTIMONIALS.

"9 Victoria Chambers, Westminster, S.W.

"June 10, 1884.

"SIR,—I have much pleasure in testifying to the efficiency of your patent Warm-Air Fire Grate. It has been very successful, and given every satisfaction where I have used it. Yours, &c.

"To Mr. Grundy. JAMES WEIR, F.R.I.B.A."

"Baptist Chapel, Clapham Common, London. Richard Webb, Pastor, 10 Grafton Square.

"February 15, 1884.

"DEAR MR. GRUNDY,—I have pleasure in testifying to the excellency and efficiency of your patent Fire-Grate. It is the most charming invention for heating a large room I have ever known. I shall have pleasure in showing it to anyone who wish to have their schools or rooms pleasantly and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool, July 1884.

"DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public.

"Mr. John Grundy." From Hon. and Rev. G. G. C. Talbot, M.A., Withington, Cheltenham.

"DEAR SIR,—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen."

"Mr. John Grundy." From F. J. Yates, Esq., Architect, Birmingham. "The best of the kind I have seen. I shall have pleasure in securing their adoption whenever opportunity offers."

Apply to JOHN GRUNDY, 30 Duncan Terrace City Road, London. Works—TYLDESLEY, near MANCHESTER.

Messrs. Laidlaw & Sons, Glasgow, are to supply the pipes, and the Glenfield Company, Kilmarnock, the valves.

# THE GREAT PROBLEM OF THE XIX<sup>TH</sup> CENTURY.

# VENTILATION

# WITHOUT DRAUGHT.

The hitherto unsolved problem of "Ventilation Without Draught" is to be seen practically illustrated at FREDERICK HENRY SMITH'S Test Room, No. 68, 52 Queen Victoria Street, E.C., Patentee of the Automatic Siphonic Aspirator System of Ventilation. A personal inspection invited.

*Extract from the Annual Report of the "French Hospital and Dispensary," issued 29th January, 1885.*

We have also to return our best thanks to Mr. Smith, who undertook gratuitously to repaint one of our wards and to apply a new system of ventilation of his own invention, which was very successful.

*Letter from David Urquhart, Assistant Engineer to Colonel Sir Francis Bolton, C.E.*

F. H. SMITH, Esq., 52 QUEEN VICTORIA STREET, E.C.

4 THE SANCTUARY, S.W., LONDON: NOVEMBER 22nd, 1884.

In reply to your inquiry, I have much pleasure in certifying that your system of ventilation as applied to the "Island Room" of the Illuminated fountains at the Health Exhibition reduced the temperature during the displays from about 110 deg. to about 70 deg., and thus enabled the men to perform their duties without inconvenience.—Yours faithfully,

DAVID URQUHART.

*Extract from the TIMES of March 14, 1885, page 7.*

"VENTILATION WITHOUT DRAUGHT.—This desideratum appears to be accomplished by a syphonic system devised by Mr. Frederick H. Smith, at whose offices, 52 Queen Victoria Street, London, we recently inspected the arrangement. The air supply is conducted into the apartment from the external atmosphere by means of air ducts, which terminate in distributing passages at the floor level. The exit for the vitiated air is placed in the ceiling, and consists of two tubes, a large and a small one, running parallel to each other between the floor joists in the case of rooms having others over them. In the case of rooms on top floors, or those having the roof directly over the ceiling, the tubes are placed concentrically, but the action and results are the same. The larger of the two tubes carries off the vitiated air, while the smaller one forms an induction tube for cold air, its outer extremity being open to the atmosphere. These two tubes or conduits are so connected that the passage of the heated air through the larger tube induces a current of cold air through the smaller one in a continuous stream. The result is a rapid clearing away of all deleterious gases and products of combustion as they accumulate, and the preservation of a pure atmosphere at an equable temperature in the apartment. In a small room at Mr Smith's offices in which five large gas-jets were burning, the atmosphere was apparently quite innocuous at the level of about 7 feet, the temperature being about 60 deg. Fahr. At a higher level, however, and especially near to the ceiling, the temperature was high and the air greatly vitiated. It was demonstrated that this vitiated air was being drawn off through the exit tube, which acted as a powerful sucker. After turning on one gas-burners, and upon the temperature of the room generally becoming lowered and equalised, a feeble upward action was still maintained in the upcast tube, but there was no down-draught whatever. The system has already been applied to a church and other buildings with acknowledged success."

**ILKESTON.**

For Brickwork in connection with new Retort-house and building Retort Beds, Fitting Shop, Chimney Shaft, &c., at Gasworks. Mr. F. C. HUMPHREYS, Engineer, Ilkeston.

Immense Stock always ready for Laying.

**THIN PARQUET**

(Turpin's Patent). 5-16 inch thick, prepared on deal back laminations, equal in wear to inch Solid Parquet. Used for Veneering old existing deal floor, and is susceptible of removal at pleasure. See Construction.

**ARTISTIC JOINERY.****WOOD CARVINGS.**

All Styles executed for the Trade at Special Rates. Skilled Artisans sent to all parts of the country.

Estimates and Designs on Application.

**ORNAMENTAL PARQUET.**

DEAL BACKING.

**VOLUME XXXII. OF THE ARCHITECT.**

HANDSOMELY BOUND IN CLOTH, GILT LETTERED.

Price 12s. 6d.

OFFICE: 175 STRAND, LONDON, W.C.

**STAINS FOR WOOD FLOORS.**

LIGHT OAK.

Applied to Ordinary Deal gives an exact imitation of Old Polished Oak Floors.

IMMENSE SAVING IN THEIR USE,

As no size or varnish is required, the application of one coat only taking the place of two coats of size, one of stain, and one of varnish by the ordinary process.

INVALUABLE FOR THE BORDERS OF ROOMS,

As they do not scratch like ordinary varnished surfaces, and the cost of staining would be about 1½d. a square yard, as against 4s. or 6s. per square yard for carpet.

GREAT PREVENTIVE TO CONTAGIOUS DISEASES.

Dr. Koch, in a recent lecture on Cholera, stated that polishing and dry-rubbing floors was a greater protection than washing floors. Prices, 10s. 6d. per gallon; 6s. 6d. per half-gallon; . per quart. Half a gallon will do a 3-foot border round a large room.

**TORBAY PAINT COMPANY,**

26, 27, and 28 BILLITER STREET, LONDON, E.C.

LAYING DRAIN-PIPES UNDER ROADS.

AN action which was tried last week in the Queen's Bench Division, before Mr. Justice Smith, indicates contractors' risks when carrying out works beneath roads. The defendant, Mr. Everitt, had taken a contract for laying drains at Richmond, Surrey, and on the 6th of last July a two-horse waggonette belonging to the plaintiff was being driven over the road, when the ground collapsed and the horses were injured, one dying shortly afterwards. The action was taken to recover damages for the loss. After a coachman had given evidence, the following witnesses were called:—

Mr. J. E. Brodrick said he was acting as surveyor to the Richmond Vestry while the work was in progress. Defendant was making a drain along one side of the road, and cross drains from the gullies on the other side of the road. The drain into which the horses fell was a cross drain. Defendant's men drove a heading under the tramway, and made cross cuttings on either side, to a depth of from four to seven

INTERNATIONAL HEALTH EXHIBITION:  
**GOLD MEDAL**  
AWARDED.  
**REDUCTION IN PRICE.**

A brick on flat and one on edge wall, suitable for Cottages, or where great economy is required. It is quite damp-proof and equal in strength to a 14-inch wall built with mortar only.

THE SUPERIORITY OF  
**THE "HYGEIAN ROCK"**  
**BUILDING COMPOSITION**

Over all other Material for rendering Walls Damp-proof and increasing their strength, is now universally acknowledged by the leading Architects, Engineers, and Contractors.

To meet the rapidly-increasing demand, the Patentee has recently made extensive additions to his Machinery and Plant, which enables him to effect

**A REDUCTION OF OVER 25 PER CENT. IN THE PRICE.**

**WILLIAM WHITE,**

Head Office and Works:—BELMONT ROAD, ABERGAVENNY.

A wall built two half-bricks on the flat is much stronger than an 18-inch wall built in the ordinary way.

The ONLY MEDAL for ROOFING TILES at the INTERNATIONAL HEALTH EXHIBITION, 1884, was awarded to  
**H. J. & C. MAJOR,**  
Late SEALY. Established upwards of 200 Years.  
**THE PATENT TILE WORKS, BRIDGWATER.**

Sole Manufacturers of Non-Porous ROOFING TILES, of various patterns, having C. Major's Patented Improvements, which, forming a double "rabbet" at the top, bottom, and sides of the Tiles, and avoiding cut or unprotected corners, make a secure lap that PREVENTS "WIND-STRIPPING" and ENTIRELY EXCLUDES DRIFTING RAIN AND SNOW.

Manufacturers of the Imperial Bath Scouring Bricks Patent and other Roofing Tiles, Bakers' Oven Tiles, &c., &c.

feet. It was a sandy soil. Defendant filled up the cuttings by throwing the sand back again and ramming. They did that also in filling up the tunnel. That was not the proper way of doing the work. It should have been done by filling in in layers, and then pouring on water to consolidate the soil. During the course of the work he called the ganger's attention to the way in which it was done, and offered to lend him a water-cart. He replied that there had been thorough ramming, and that there was no necessity for water. It was not possible to ram sand without the use of water to prevent a subsidence. The ganger did not accept his offer of the water-cart, and witness told him he should hold him responsible for anything that might occur. On the afternoon of the accident he went down to see the place. He did not notice any water on the road at either side. The horses were still there. He saw the hole into which they had fallen. The ground in the cutting appeared to have sunk from two to three feet. After the hole had been filled in temporarily, he went and saw defendant's foreman, and told him what had happened. Defendant's men subsequently filled in the cuttings, several of which had sunk. At the time of the accident defendant was still carrying on the work. The thunderstorm referred to by the last witness lasted about an hour and a half.—Cross-examined witness said the road was never closed for traffic. The contractor had not cleared up everything at the time of the accident and completed the work. He was surveyor *pro tem.* at the time of the accident, and took his orders from the vestry clerk. He had previously been road foreman. Mr. Brunton was surveyor at the time the contract was entered into. Witness was not a member of the Institute of Civil Engineers.

Mr. J. M. Lucas, builder, of Richmond, said he had had considerable experience in the making of drains. He remembered the thunderstorm which took place on July 6. It was a very heavy storm, and an enormous quantity of rain fell. He went to the spot where the accident happened about twenty minutes after the occurrence. The ground seemed to be

honeycombed and soft, and he put a stick down 2 feet 6 inches without any great pressure. The ground in the locality was sand. A cutting of this kind should have been filled in in layers and in a dry season such as when this work was carried out lots of water should have been used. His experience went to show that it was impossible to effectively fill up cuttings of this kind without the employment of water. Judging from what he saw he should say that the cutting was not properly filled up, though he did not see the work done. If the cutting had been properly filled up, the accident probably would not have happened. He noticed that there had been a sinking in three places.—Cross-examined: He was a member of the Vestry at the time the contract with Mr. Everitt was entered into.—Mr. W. Beard, drainage contractor, of Twickenham, said he was acquainted with the locality where the accident happened. He had had great experience in the making of drains and the way of filling them up. He was of opinion that the work in question had not been properly carried out. He explained how it should have been performed, and said the sand should not have been put in dry. In many cases he had made arrangements with water companies to turn in tons of water for purposes of consolidation.

This being the plaintiff's case, Mr. Charles, Q.C., addressed the jury for the defence, and contended that the works were performed in a proper and efficient manner in accordance with the contract, and that there was no neglect of any sort on the part of Mr. Everitt. He further argued that if any one was to blame it was the Richmond Vestry, and he maintained that the accident was caused by the heavy rainfall, coupled with the insufficient outlet provided by the Richmond Vestry.

Mr. Charles Everitt said he entered into a contract with the Vestry to construct a drain from the river to the south end of Kew Road. He commenced the work upon the order of Mr. Brunton, the surveyor. He began to do the work from the river in March, and as soon as he got to Mr. Poupert's land he was refused permission to enter, and he had to start again at a

manhole at the bottom of Sandy Lane. He inspected the work while in progress and when completed, and considered it was efficiently done according to the contract. On June 12 he wrote a letter to the vestry clerk, stating that he should shortly have finished the drain in Kew Road. The work was absolutely finished on July 5. The part where the accident happened was finished before that time. He subsequently inspected the scene of the accident, and considered it happened by an extraordinary fall of rain and there not being a proper outfall. He had received a final certificate for the completion of the work, but had not received all the money. There were no complaints made to him as to the way in which the cuttings were filled in. When the contract was let the Richmond Vestry knew the character of the soil and should have made provision for it.—In cross-examination witness said he had been a contractor for nine years. He had had several contracts for drains before. He had a previous contract for a sand and gravelly soil. In the present case he faithfully carried out the provisions of his contract. The way the drain was filled up was not the proper way to fill up drains with sandy soil. The soil was peculiar, and water should have been used.—The Judge: That you knew?—Witness: Yes, my lord.—Cross-examination continued: When the ground was opened he observed that it was loamy sandy soil. It was questionable whether it was possible to fill in this trench so that it could not sink. But for the storm this portion of the road would not have sunk. The cause of the accident was the water lying on that portion of the road where it happened. He knew that the trench was safe but for an extraordinary rainfall.—Re-examined: Apart from storm, the trench was properly constructed. Parts of it had been driven over for three weeks before the accident.

Mr. George Constable, assistant at the Meteorological Observatory at Kew, said that the thunderstorm referred to was most unusually and extremely severe. With one exception the rainfall on that occasion was the heaviest since 1858.

## ELECTRIC HOUSE BELLS.

For Mansions, Banks, Hotels, Houses, Offices, Yachts, Houses to Stable, and all purposes. LIGHTNING CONDUCTORS. FIRE TELEGRAPHS. SPEAKING TUBES.

**FRANCIS & CO.,**  
Eagle Telegraph Works, Hatton Garden, London, E.C.

Catalogue on application. Estimates free. Best Goods only. The Trade supplied.

## ELECTRIC HOUSE BELLS.

FIRST PRIZE MEDALS from all the leading Exhibitions at Home and Abroad.

## ART PLATES FROM "THE ARCHITECT."

Proof Impressions of the following Illustrations which have appeared in "THE ARCHITECT" can now be obtained in a separate form suitable for Framing:—

### The Banquet.

The well-known and beautiful Chromo-lithograph by H. STACY MARKS, R.A.

Size, Thirty-nine Inches by Fifteen Inches.

Price One Shilling; free by post, carefully packed inside patent roller, One Shilling and Threepence.

## SHAKSPERIAN DECORATIVE PANELS.

BY H. STACY MARKS, R.A. (Printed in Colours.)

1. Scene from "The Tempest."
2. Scene from "Midsummer Night's Dream."

3. Petruchio and the Tailor.
4. Falstaff in the Buck Basket.
5. Touchstone, Audrey, and William.

6. Falstaff acting the King.
7. Parolles' Eyes Unbound.
8. Malvolio in the Garden.

Price One Shilling; free by post, carefully packed inside patent roller, One Shilling and Threepence each; or the set of Eight, Five Shillings; by post, Five Shillings and Sixpence.

May be obtained from all Newsagents or Booksellers, or from the

Publishers, **GILBERT WOOD & CO., 175 Strand, London, W.C.**

Mr. Herbert, clerk of the works at the time of the execution of the works by Messrs. Ford & Everitt, gave evidence as to the insufficiency of the outlet.—William Winslet, foreman of the works, said they were thoroughly done. After the pipes were laid they were filled up level to the tops, and then about a foot layer of earth was added, and so they continued ramming and filling. On the Saturday previous to the accident the works were just completed. He was called to the spot shortly after the accident, and saw traces of water on both sides of the road. The parish men filled in the trench after the accident. All the trenches were filled in properly when he left them, and had been run over for some weeks. He accounted for the accident by reason of the severity of the storm.—John Smith, tramway inspector, gave evidence as to the flooding of the Kew Road on the day in question.—Cross-examined, witness said he did not recollect having told Mr. Lucas that he considered the work was disgracefully done, and that he wondered there had not been more accidents.

The Judge having summed up, the jury, without leaving the box, found that the injury was occasioned by the neglect of the defendant, and by reason of his not *bonâ fide* carrying out his contract. A verdict was therefore entered for the plaintiff—damages 90l.

### BRICKFIELDS AS NUISANCES.

TWO actions were tried together lately before Mr. Justice Cave, in which the owners and tenants of property at Streatham sought to restrain Messrs. Neal, brickmakers, from burning bricks in such a way as to interfere with their enjoyment of their property. At one time soft core was burnt, but for more than a year it was buried instead. The defendants therefore denied that anything more was going on upon their premises than the ordinary process of brickmaking, but it was contended for the plaintiffs that both the "breeze" and the fine refuse, combined with road-scrappings, would

inevitably contain organic matter, and that noxious fumes, of a different character from those of mere burning clay, did, as a fact, come from the burning clamps of brick. A great mass of evidence was adduced on either side as to the nature and extent of the alleged nuisance. Among other witnesses for the defence were two sanitary inspectors and three members of the Wandsworth Board of Works, as well as the medical officer for Streatham, who said that they had found no offensive smell on the defendants' premises. The quantity of bricks made by the defendants was in 1883 1,800,000, and in 1884 2,100,000. In 1884 the materials used were, according to the defendants' evidence, 500 yards of refuse, 400 to 500 yards of road-scrappings, and 5,000 yards of clay.

Mr. Justice Cave delivered judgment in favour of the plaintiffs. His lordship said the plaintiffs had to make out that there was a nuisance, and a nuisance which not merely affected this, that, or the other individual, but one which substantially affected the plaintiffs themselves in health and in the comfort and enjoyment of their premises. The first nuisance alleged arose from the heap of house refuse. He (the learned judge) had no doubt that that heap gave off vapours and smells which constituted a nuisance, but he did not find evidence to satisfy him that that nuisance affected the plaintiffs. So there was undoubtedly a nuisance from the burning of "soft core;" but having regard to the time of year at which the core was burnt, and that at which the nuisance was perceived, there was no evidence that this nuisance affected the plaintiffs. On the contrary, his lordship was satisfied that it did not. Then came the third point. It was said that a nuisance arose from the burning brick, and this was the chief point. There had been a discussion as to whether there was a nuisance to health from this cause as well as a nuisance to enjoyment. The evidence satisfied him (the learned judge) that, so far as the brick-burning went there was no nuisance to health in the sense of causing disease or illness. There remained the question whether there was a nuisance which affected the plaintiffs in the

comfort and enjoyment of their premises; but he should first inquire whether there was a nuisance which affected anybody. Reviewing the general evidence which had been given on this subject, his lordship said that, in face of the medical evidence given for the plaintiffs, he could not believe that the use of animal refuse in brickmaking did not create a nuisance to the neighbourhood, and the officers of the district Board of Health who had been called as witnesses impressed him very unfavourably by the way they gave their evidence. The nuisance arising from the burning of "soft core" had been going on for four years, and so had the nuisance arising from the heap of house refuse; yet the local inspectors had found out nothing about it. This consideration materially affected the credibility of their evidence, especially when he (the learned Judge) remembered that Bartholomew and Finister (two of those witnesses, the latter the inspector of nuisances) gave their evidence with a strong bias in favour of the defendants. On the whole, the evidence for the plaintiffs very much preponderated, and his lordship was clearly of opinion that there was a nuisance at the brickfield. Did this nuisance affect Mr. Dunston and Mr. Seely? After reviewing the evidence as to the distance to which the smell travelled, and as to what had been perceived at Mr. Seely's house, his lordship said he was satisfied that there was a nuisance which could be perceived at the plaintiffs' premises, and to such an extent as to render the occupation of their houses uncomfortable and unenjoyable. The learned judge then went into that portion of the case relating to the destruction of Mr. Dunston's crops, with the result that he found the evidence not sufficient to establish that the nuisance had caused any injury to vegetation. His lordship therefore directed judgment for the plaintiffs on the first part of the case, with an injunction to restrain the burning of bricks in such a way as to interfere with the comfort of the plaintiffs. With regard to the injury to the crops, his judgment was in favour of the defendants, and the plaintiffs must pay the costs under this head so far as they could be separated.

## REDUCTION IN PRICES OF TILES. MALKIN, EDGE & CO., BURSLEM,

*Have Reduced the Prices of all their PATTERNS of PLAIN and ENCAUSTIC FLOOR TILES; and also of their GLAZED, ENCAUSTIC, PRINTED, and PAINTED TILES.*

# The Architect.

## THE WEEK.

WE lately announced the marriage of M. DE NEUVILLE in his sick room, and with much misgiving expressed a hope that, as the ceremony was a recognition of a long devotion, it might lead to his recovery. On Wednesday the artistic world of Paris was saddened by the death of the painter, and with reason, for ALPHONSE DE NEUVILLE was a type of the modern French artist. He had sacrificed much for art, for as the son of a wealthy merchant he might have aspired to a prosperous position in the State. He preferred art, and for many a year he endured the toilsome life which seems like a test of a man's sincerity. He worked hard and at low pay as an illustrator of books and periodicals. The valiant efforts which were made by a people who had been purposely disorganised by Imperialism inspired him with a desire to produce less fleeting works, and he painted on canvas scenes in the Invasion instead of drawing them on wood. But connoisseurs professed to see in his efforts nothing more than illustrations in colour; and if it were not for the amazing vigour of his battle-pieces, he must have been set down as a failure. His pictures were reproduced and made his name known through Europe. With his affectionate friend, M. DETAILLE, he painted the panorama of *Champigny*, which was unlike all preceding works of the class. The position he had attained was shown by the selection of M. DE NEUVILLE by a London firm to paint pictures of the recent English battles in Africa, and he entered into the work so loyally that his appointment was made a subject for congratulation.

MOST noteworthy among his masterpieces are *Dernières cartouches*, *Le combat sur les toits*, and *Attaque par le feu d'une maison barricadée*. The deceased painter was born at St. Omer in 1836 of good family. He entered the Naval College of L'Orient in preparation for joining the navy. It was while at this college that his extraordinary facility in using the pencil and his rapid progress in the study of perspective attracted the attention of the professors, and ultimately extorted from M. DUBOISSET the prophecy that the young pupil would end in becoming an artist. This made a great impression on DE NEUVILLE. He passed the examinations for the navy with success, but his family opposed his taking further steps towards entering the naval profession, as they wished him to study for the bar as a means of obtaining a Government appointment. DE NEUVILLE meanwhile bowed to circumstances, made his three years' legal studies in Paris, acquitted himself with great success, and returned to his home. Much of his time in Paris had been spent in the Champs de Mars and at the Ecole Militaire in studying the attitudes and habits of the soldiers and sketching military scenes, and his father finding it was useless to oppose any longer his artistic tendencies, sent him back to Paris, and at the age of eighteen he entered the *atelier* of M. PICOT, where he made the acquaintance of many of his future competitors in art. One of his pictures attracted the attention of EUGÈNE DELACROIX, and was the means of opening the doors of that select *atelier* to DE NEUVILLE.

WHEN there are two artists who have similar, or nearly similar, names, how is the identity of the individuals to be determined, and when there are honours how are they to be apportioned? In Paris, for example, there is a small street near the Batignolles containing several studios, which is dedicated to "ALFRED STEVENS." We have heard English art students refer to it as a testimony of the recognition by the Parisian authorities of the genius of the designer of the Wellington Monument, and they were very severe on the English indifference to the great artist. But the Belgians claim it for their ALFRED STEVENS. Who is to decide? In Belgium M. ALFRED STEVENS does not obtain all his honours, because other men have been given the same name by their sponsors. The Dutch Government lately sent him the cross of the Order of the Lion for the brilliant part

taken by M. STEVENS in supporting the Amsterdam Exhibition. But a clerk in the Belgian Chancellerie, to whom the honour was entrusted, took the first of the name in the directory, and sent the cross and diploma to another artist with a similar name. The latter thought he might keep within the law and yet gain advantage for himself by returning the jewel and retaining the diploma. The Belgian judges are, however, rather dull in comprehending delicate differences of this kind, and the painter has not only been deprived of his windfall, but has been fined and publicly reprimanded for the chancellor's blunder. It was wrong on his part to imagine that he co-operated in the Amsterdam Exhibition, but if he signed his pictures "A. STEVENS," and a purchaser was induced to imagine that he had obtained a work by the ALFRED STEVENS whose reputation is not confined to Belgium, the law can only approve of the transaction.

THE authorities at the Royal Academy are at present exercised by the discovery of signs of vandalism enacted within those august walls. It appears that cuts and scratches have been discovered on many of the pictures exhibited, and the pictures of Sir FREDERICK LEIGHTON have suffered conspicuously. The perpetrator of the mischief does not appear to have done any irreparable damage, as the scratches seem as a rule to be confined to unimportant parts of the pictures. One of the most serious instances, it is said, is that of Mr. ORCHARDSON'S portrait of *Mrs. Ralli*, a picture hung in Gallery No. 1, within a few feet of the attendants stationed at the turnstiles at the top of the grand staircase. The damage sustained consists of scratches, one being an irregular curved indentation, deeply and boldly made, on the lower fold of the gown, and measuring at least four inches. Another scratch, about two inches long, was across the gown at a higher point, and others less important appear here and there.

It is to be hoped that the architectural profession, which, according to some people, is accountable for the misdoings of unprofessional blunderers and many of the evils suffered by humanity, will not be accused of causing the illness of VICTOR HUGO, for a correspondent informs us that the illness of VICTOR HUGO is greatly due to the prolonged cold of the season, to which he exposed himself in consultations with the architect on the site of the residence that he is building. His present house is humid, and the sitting-rooms are not well ventilated.

AN important project will shortly be brought under the consideration of the Municipal Council of Paris, being nothing less than the creation of a monumental necropolis on the largest scale. It has been examined by several of the most influential members, and has secured their approval. The Architectural Commission of the Council, over which M. HATTAT presides, has reported favourably on the scheme. The advantage of it at the present is, that if approved it will give an opportunity for works on a grand scale, and in the existing state of the labour market that would count for much. The necropolis would also increase the means so dear to a Frenchman's heart of rendering names immortal.

RAILWAY construction in the United States is considerably affected by the state of the trade of the country, and when business is most flourishing the laying down of lines proceeds at an increased rate. The total length of new railway constructed in the United States this twelvemonth is stated to be 308 miles, against 595 miles at the corresponding date last year, 1,071 miles in 1883, 2,283 miles in 1882, 906 miles in 1881, 1,096 miles in 1880, 391 miles in 1879, 267 miles in 1878, 269 miles in 1877, 432 miles in 1876, 220 miles in 1875, 375 miles in 1874, 654 miles in 1873, and 1,070 miles in 1872. The figures represent main lines only, and not second lines or sidings. The rate of construction is apparently now about the same as immediately before the burst of railway speculation which accompanied the revival of trade in 1879, though it is still larger than during the most depressed period after the crisis of 1873.

## THE STUDY OF NATURE IN ARCHITECTURAL DECORATION.

IN art, as in everything else, as the Preacher says, "wisdom is profitable to direct." The indiscriminate use of good material may be as fatal as the adoption of bad material. Good principles applied without judgment may be equally disastrous with bad ones. Selection, fitness, a just discernment of the end through the means must be always kept clearly in view. That is to say, art in its highest and noblest form requires, above all, that unity of purpose be maintained, that a large grasp be taken of its ulterior aim and complete realisation as an organised totality, not admitting of anything to be taken away from it or added to it without injury. This is an absolute rule, not in one, but in all of the arts. Largeness, breadth, keeping are essential principles, and included in the term. Detail must always be made subservient to breadth, to the constructive idea, and must enhance as well as enrich the work in its whole dimensions. Over the latter it must never be allowed to prevail for a single instant. Every leaf, every touch of ornamentation should have reference to the completed work, or, in other words, they must take the scale of the structure, so to speak, and become a part of it. The mind must never be allowed to fix itself on any part which is not connected with the whole, which does not directly or indirectly lead it from the particular to the general, just as a magnificent fragment of a Greek moulding might bring before the intelligent observer the whole structure of which it formed a part. It would be an old and trite story to dwell on relationship and fitness in art in the general sense of the terms; yet there is a sense of these terms on which it may well be worth dwelling for a few moments in another aspect, namely, how far the study of nature is to be carried in the production of those forms which are intended to be auxiliary, and are not intended to appeal to us from their intrinsic individuality. Although the laws or rules that govern in this matter are much lost sight of, our task in their exposition is not a difficult one. Much will be conceded that commonly is only imperfectly followed. The appropriation of the principles to be expounded in art and practice, however, may be more difficult in their requirements of self-denial and disinterestedness. Let us examine the question a little more particularly.

In the construction of a work of art it is not only necessary that detail should occupy its proper relative position, but also that the detail in itself should be studied and worked with special reference to the purpose which it is intended to serve. A piece of absolute realism, however interesting and valuable in itself, might become injurious as an accessory of a larger composition if it distracted the attention and detained observation too long from the entire design, and did not rather lead one to expect and look for something more than itself. It will be seen from this point of view that a close realism would be lost, even mischievous: a literal following of Nature to its utmost detail, disturbing and confusing to the wider perception. Here the directing "wisdom" must come in. A different mode of study is required from that of mere reproduction of form. A higher rule must prevail: that of organisation. Attention must be directed to the broader significance of law and growth, and for the purpose of reaching this it is proposed here to offer a few suggestions.

The higher significance of form depends not so much on the imitation of its material aspect as in penetrating the law of its growth or development, and striving to embody that rather than the substance which clothes it. It will always be a question in art in general how far the real must prevail in its relationship to the ideal. But in the particular art now under consideration, that of architecture, the question becomes much simplified. Architecture is not an imitative art in the sense in which painting and sculpture are so. It follows no law of growth or construction, but that of the mind or intellect, of which it is the outgrowth. It does not go for its forms to those of Nature, but they are supposed to arise from the interior sense, creative at second hand, as it were, by the perception of those organic laws which work in the forces of Nature by which it is surrounded. Thus Nature herself becomes reflected and transfused through the mind of the architect. We have thus primarily

a different principle upon which to work from that which prevails in the imitative arts. Let us at once define and accept it.

This principle implies a study of the modes and conditions of Nature's manifestation of form, rather than the rigid observation and reproduction of her minute detail. The architect must direct his attention to quite other attributes of the forms which he sees around him than those of which the painter makes selection. The one observes form, it is true; but his attention must be at least equally directed to colour. This the architect need not regard in his professional capacity. Form he must observe closely, but chiefly in its larger, broader, and more solid aspects. Light and shade he must look to as well, for these are no less important to him than to the painter. A shadow to him is often as useful as the structure which causes it. But, above all, he must look to the movement, the character, the individuality of the object which he studies. These are the most valuable qualities to him. If he has these accurately and clearly defined to his perception they are all he wants or can make use of. These qualities once understood and received into the mind, he will have no need formally to conventionalise what he has observed. It will resolve itself into the most fitting condition for adaptation to his purposes. The architect must be a close observer of Nature, but he must endeavour to eliminate from its forms what he does not want, only retaining those characteristics which are likely to be of service to him.

Beyond and above geometric forms of ornament solely depending on the more or less regular distribution and arrangement of inorganic shapes and lines—that is, those which contain no suggestions of growth and vitality in themselves—may be ranked those the elements of which are gleaned from the manifestations of life which are around us, and which, becoming digested or transfused, as it were, in the mind, are made the means of expressing individual character, and are adapted to a definite purpose or object in carrying out a structural art idea. Of these forms the vegetable may be taken for first consideration.

As to the selection of plant-growths which are best adapted to be reproduced—or, let us rather say, recreated—in solid material by means of the chisel, those of broad distinctive features should be chosen—those of the fewest lines and most characteristic ones, whose law of growth is not rigid and uncompromising, as is the case with most of the ferns, for example. Forms of many lines, sharply dentated, or of small partial proportions, should for the most part be rejected as unsuited for simulation in solid material. The large, simple, and broad are more suitable to this purpose. Having selected the form, it must be studied first in the direction or movement which the branches, stalks, leaves, or flowers take in their growth. Every tree, shrub, or succulent plant has a certain habit or mode of growth distinct from every other, generally in proportion as it differs in kind or relationship. Each tree has its characteristic angle of ramification, each bough of each tree its peculiar bend or sweep or sturdy uprightness of growth unlike every other. Still more variety in these respects mark those plants which are, on the whole, better applicable to sculptural treatment than the arborescent. This outward and general character, therefore, should be the first to be carefully and accurately studied: what kind of curves, distribution of parts, direction and mode of growth constitute the special type—the *intention*, so to speak—of the object under study. These characteristics should be compared with those of other types and kinds, and the differences noted, in order to give force to the pronouncement of what is distinctive and special. From these the student should pass to the consideration of the lines and features of the individual parts. He should regard the modelling of the stalks, leaves, and petals, leaving out those qualities which he does not require as not adapted to his purpose, as, for example, all accidental markings, hairs, stamens, pistils, and other protuberances, excepting in so far as they can be accommodated to the general spirit of his work. Anything requiring deep undercutting, or which is liable to be easily broken, should be religiously avoided. As a rule the flatter the adaptation the more useful and valuable will it prove. Every adaptation of forms thus thoroughly studied would always carry with it some suggestion of natural growth and recall that essence of vitality which is the soul of art, never to be gained by a

superficial imitation of Nature, but resulting from penetrative study broadly and conscientiously undertaken.

From the consideration of vegetable forms we may pass to those of animals. Here the same rule must prevail. Anything like bold realism and naturalism must be avoided. Thorough study must prevail over a slavish imitation of form merely as such. That is to say, those characteristics are to be selected which give force, energy, vitality to the object represented, without adhering to a tame reproduction of detail which would detract from the impressiveness of the work as a whole. Thus in the treatment of the forms of birds, what would be required would be a careful attention to the lines which distinguish the individual selected from every other kind of bird. Anything beyond this, as the attempt to reproduce closely the texture of single feathers, or other minute details, would generally be worse than useless in decorative work. So also in representing animals, the qualities to be sought must be those which are distinctive to the individual, not a slavish following of characterless detail. The dog must have all the marks of the canine nature upon it, in shape and movement. The horse must move and live. The stag will embody lightness, ease, and elegance; the elephant, solid ponderosity and strength; and it will be necessary to keep these qualities specially before the mind as the most important in producing them.

From the consideration of animals, we may rise to that of the human figure. Here, as in the other cases, broad character must be the basis of whatever is required for sculpturesque decoration. Strong expressions of feature and movement, where strength and motion are required, should be conveyed broadly and with a large style of representation. Folds of drapery should be represented generally with as few lines as may be. The disposition of figures should be as little crowded or confused as possible. Dignity and simplicity should be always aimed at with a due regard to place, subservience and harmony. For it must be remembered, as has been already said, that ornament and decoration are for the purpose of giving value to the larger idea, and must not distract attention or detain it too long from the totality of the structure.

Thus it will be seen that the training of a student of architectural decoration should differ from that of one preparing for pictorial representation, whose labour must be wholly given to the complete and exhaustive study of that which he sees around him. The former, however, cannot make Nature in its entirety of form, light, shade, and colour his only field. The structural idea must be his main one, and everything else must be subservient to it. He must go to Nature in search of those qualities which he requires, and let all others go by him, if not unremarked, unrepresented. By this mode of study, by carefully limiting his labour, he will concentrate his energies. What he does select he will be able to represent in a more characteristic manner. His work will have the impress of a purpose upon it. Instead of occupying himself with an elaborate pictorial treatment, undigested and unselected, of what he sees around him, he will choose what is best adapted to his purpose. His objects for representation chosen, he will then select those qualities in them, and only those, which recommend themselves to the end which he has in view. The very faculty of thus choosing will be useful to him. It will contribute to purity and simplicity of workmanship, to the elaboration of large ideas, instead of to confused and insignificant modes of appeal which often smother the broader purpose.

Such a manner of studying the essential properties and characteristics of things would also react favourably on the structural faculty. It would tend to give an organic vitality to architectural design. It would enable the architectural student to arrive at *law*—Nature's law—in the putting together of material. And though such a result might be as indirect as it would be unsought, it would be sure to give some kind of colour or modification to the inventive faculty in structural design. At least it would educate the perceptive faculties in the appreciation of forms of grace, beauty, and expression. How much more valuable to the architect would such a course of study and observation be than the aimless dabbling in pictorial representation in which so many waste and dissipate their energies, and in which they only rarely excel! For it is seldom that the firm lines and uncompromising fulness of delineation, the result

of an architectural training, lend themselves to the genial flow and easy movement required for the less severe and more imaginative pictorial mode.

## ELY AND SALISBURY CATHEDRALS.

[BY A CORRESPONDENT.]

MUCH has been written about the glorious cathedral of Ely. No one can go into it and come away without realising that there can be scarcely any more perfect style than the Early English, particularly as displayed in the Galilee porch at the west end, and also at the east end. There are the simple forms—the product of true common sense—the mouldings apparently complex, but yet simple in their planning when carefully studied. All these details of the fully-developed Early English style tempt me—not a tyro—to say that the utmost ingenuity of man could hardly devise anything better. The scheming of the wall arcade of the Galilee in two distinct orders, the one at the rear springing from a higher level than that at the front and the arrangement of the vaulting display the work of a master mind. For a western doorway that at Ely is more like a Continental example in its proportions, though not in other respects resembling foreign work. But then it is the only west door, so ought to be of some importance. Whereas the west façade of a cathedral like that at Rheims boasts three grand portals, those at the side but little inferior to the central one. The Devonshire marble used in place of the original Purbeck shafts is very inferior in its effect, and makes a sorry substitute for the original material. It is remarkable how far this half-stone, half-marble, from the Isle of Purbeck was carried. One would have expected to find some more local material used. But it is sad to think how wanting in durability this noble-looking stone has proved, even when used internally. It is frequently said at the present day that, as a matter of principle, we ought to use the materials of the locality where we are building. Yet this, as we know, was by no means the invariable practice of the Middle Ages. Caen stone was brought to England (the water-carriage of course much helped its easy transportation), and the Normans were doubtless fond of the material of the country whence they came, besides being sensible of its being so easily workable. The pavement of the nave of Ely Cathedral is composed of unpolished marble in different patterns, but I question whether this will stand wear and tear as well as if polished.

In the choir triforium one notices how the effect of the later work by ALAN DE WALSINGHAM is marred by the tracery being thin and flat. This is not so in the earlier architecture, which is more effective. The cusped arch of very elegant design over each of the choir stalls looks well, every compartment containing sculpture of some scene from Scripture. Above is canopied tabernacle work, a variety from the more usual feature of a forest of pinnacles, &c. In the choir screen, the mixture of oak and metal work is not happy: it seems a pity that oak was not used entirely here. In the groining of the lantern Mr. GAMBIER PARRY, by arranging the colours alternately between the ribs, has cleverly managed to convey the appearance of strength. The painted figures of angels bearing various musical instruments are certainly exquisitely conceived. In the east end of the cathedral the fine arched windows were skilfully designed by the Mediæval men, and not only is there the charm of the general pyramidal outline formed by each arch springing from a different level, but the side windows become more narrow as they retreat from the central one. I am aware that other Mediæval examples are arranged in much the same way, but think it worth drawing attention to, because in modern work, in the rather rare cases where a "quintet" is employed, all the windows are generally made of the same width, though of varying height. Turning to the modern work at Ely, the colouring of the reredos is certainly most successful. The effect of the alabaster by itself is rich, but the delicate and sparing use of gilding, and the tender greens and reds of the other marbles used, combine to make a harmonious whole. The figure sculpture is very slightly tinted and gilded. The work does not look *unfinished*, as it is rather apt to do when colour is applied to stone or alabaster.

The sloped coping to the lower part of the buttresses to the Lady Chapel (or Trinity Chapel) at Ely, where they are thicker below the coping, has a pleasing look. The exquisite and rich wall arcade continued round the whole of the interior of this chapel is probably the finest thing of its kind in Europe. But the clunch or chalk of which it is constructed has a rather whitewashy appearance, inferior to that of the regular freestone. There can be no more legitimate, yet more elegant or effective, way of decorating the interior of a church than by a ground-storey wall arcade running all round it, and seeming to bind all together. It is even better applied here than externally. The arcade is in truth a richer mode of getting somewhat the same effect obtained by the fashionable dado. The exterior of the lantern to the cathedral is scarcely successful; the timber covered with lead looks flat; of the internal effect, of course, there can be but one opinion. It is one of the chief glories of the noble cathedral, and, as has been well said, "seen from afar off it is as completely a landmark to the whole of the fen country as is the tower of Mechlin to the lowlands of Brabant." The effect of one noble western tower, as at Ely, is in most cases better than two towers of necessarily smaller dimensions.

In the guide-books much is said about the superiority of Salisbury over other cathedrals, owing to its being built all in one style, except the tower and spire, which are a little more ornate, and exceedingly well planned, though of later date than the rest of the cathedral. There can be no doubt whatever about the harmony, completeness, and beauty of proportion of the exterior. But is there not a suspicion of coldness and want of life in it? The evidence of several ages of personal work displayed in a cathedral where Norman, Early English, Decorated, and Perpendicular styles exist side by side, gives an intensely human interest to the building. Doubtless as an architectural composition only it is not so perfect, for the tastes of the archæologist and historian in this particular are in conflict with those of the architect. The exterior of Ely is by no means equal to that of Salisbury, but there is more variety in it. In the latter, when the spectator has examined one part he has a general idea of the rest. Besides the perfect grouping of the cathedral itself, there is the charm of the singularly pastoral character of the surroundings, the ample space with soft green sward, the fine elms, and so on.

Every time I visit Salisbury I become more convinced that one grand central tower, or tower and spire, is what is to be aimed at in the design of a cathedral. The picturesque outline of such a ground-plan, with its double transepts and deeply projecting fine porch, is better than two puny western towers and a central one of insufficient height. In looking at the roof, I cannot avoid asking why should not lead roofs have ornamental bands, and thus become more connected with the substructure? It is true that in Mediæval work, except in the foreign *fleches*, one does not find such ornamentation; but it might be attempted nevertheless. Speaking of the interior of this and other churches, it should be noted how the horizontal lines and strings, or divisions, carried round the ends of the transepts, help to connect the composition.

One of the advantages of a church being built all at one date is that the various parts are well fused together. For example, the parapet and buttresses to the north porch range with the aisle roofs, while the ridge of the roof of the former unites with that of the aisle. In the same way the great screen wall (for that is what it really is) to the west façade is ingeniously contrived so as not to conspicuously appear a screen. The suggestion of the clerestory windows, and the parapet above them, is carried round to it, and the aisle roofs returned on the east side of the screen. There is also a raking species of ornamental buttress above the aisle parapets, which further serves to link together the aisles and western turrets. In the nave piers the central main shafts have double neckings to the capitals—*i.e.*, one a little below the other. This is effective, as it gives extra depth where wanted. On the other hand, the capitals of the subsidiary shafts have only single neckings.

I cannot say that the contrast between the dark polished Purbeck marble shafts and the light-coloured freestone is pleasing. As a matter of harmony of colour it would have been better had the shafts been of greyish Forest of Dean or red Mansfield stone. Many people object *in toto* to the

colouring of the stone mouldings, as in the choir, no matter whether of Mediæval authority or not. It is averred that the effect of light and shade is thus quite obliterated. I cannot help thinking that there is a little truth in this objection, as they are certainly somewhat neutralised and less observable. But are not the lightness and vigour as well as warmth of the colouring an improvement on the coldness of the bare stone? The effect of the crudity of the greens and reds at Salisbury is not happy, though supposed to be a faithful restoration of the ancient colouring. Still, one ought not to judge by a single random example, but rather turn to look elsewhere, at such beautiful work for instance as that by the veteran GAMBIER PARRY at Ely and at Gloucester Cathedrals. The correct principles of the harmony of colours are certainly better known now as regards wall-painting in England than in the Middle Ages.

The gorgeous chancel screen at Salisbury must be looked upon as a fine composition of the nineteenth century. The mixture of silvering and gilding is a novelty, and I think successful, and in design and execution all that could be wished. The gas standards within the altar rails are also magnificent. But the important question arises, does all this elaborate metal-work, however beautiful it may be in itself, suit the character of the building and its surroundings? I imagine there can be but one answer, and that in the negative. A rich uncoloured wrought-iron grille, sparingly gilded, or, better still, a handsome oak screen, would have better harmonised with the thirteenth-century work around. Again, one cannot but feel that no quantity of colour in the great arcades of the choir, or any amount of richness in the stalls and seats, can compensate for the absence of tabernacled canopies which are so powerful in emphasising and dignifying a cathedral choir. This is a great want at Salisbury.

The huge and unwieldy organs now built in our ancient cathedrals, where no structural provision for them exists, have resulted in more than one instance in Architecture being rather pushed to the rear by her sister, Music. The enormous pedal pipes and bellows in the north transept of Salisbury Cathedral obstruct a considerable part of some of the windows.

## GLASS-PAINTING.

ON Tuesday evening Mr. Hardman delivered an address to the students of the Birmingham Society of Arts and School of Art on the "Art of Glass Painting" at the Central School, Midland Institute. The lecturer asked his hearers to consider first the principles upon which the art of stained glass was founded. The art was primarily an architectural art, and not a pictorial one. Windows were not built to receive coloured pictures, but, being necessary features of buildings, they were gradually ornamented for richness and effect, as walls were ornamented by carving and painting. The ornamentation was purely decorative, so that the lines of the architecture were never lost. The windows were simply part of the buildings, and as such, when ornamented, decorated the whole. Stained glass, as an architectural art, should be judged accordingly, and if this were done many criticisms which were passed on decorated windows would be avoided, and people would derive pleasure from what sometimes they condemned. The development of the art might be traced, guided by these principles, with the stages of architecture, from the period of the round arches to that of the pointed arches, and on to the time when the principles of architecture were lost in the strife to obtain a pictorial representation. The art commenced with a sort of mosaic—the colours being on different glasses, with a framework of lead. The earliest coloured glass was of the Norman period, consisting of simple lines painted in opaque pigment on the glass. From simple forms of outline the next stage was geometrical forms—such as scrolls and conventional leaves. Then came figures drawn solely by lines without any shading, drapery being represented by a clustering of lines. The round arch of the Norman period gave its form to all the ornamentation, and when the Pointed arch came in the ornaments became more pointed. The lecturer here expressed his regret that the name of Early English was so often perverted. Furniture and brasswork, he said, were exhibited in shop windows as Early English which were not of the A.D. 1250 style, but of the style of Queen Anne, or a later period. The foliage in a conventional form, the lecturer continued, gave way to a truer representation of nature, but the principles of architecture were still adhered to. In the Early English period the shading of figures was resorted to,

and forms were still more naturally produced. In the fourteenth century a discovery was made which formed an important feature in the stained glass of a later period. In the earliest period the colouring was on separate glasses, but in the later period they discovered a method of staining white glass yellow, and securing various shades of that colour. Then bands of colour were introduced, so that the most beautiful effects were produced. In the thirteenth-century style the figures were placed in panels, with diapers in red or blue glass, but in the later period the figures were placed in canopies, which formed a most important feature in the fourteenth-century glass. This was more the case in other countries than in England, the canopies in some countries being made to a very great height. In the fifteenth century—the Perpendicular period—there was a great change. More attention than ever was paid to natural forms, and a greater attempt at perspective was made; and the great principle that it was an architectural art to be carried out on the flat was observed. The stains in this period were not confined to yellow or white glass, but it was put on blue glass, and thus produced a green colour, while greys and blues were added. All this while the progress of this art was but the prelude to its decay. Glass-painting rapidly declined, till it became, not an architectural art, as it commenced, but a pictorial art, losing altogether its former character. The lecturer then proceeded to touch upon the technicalities of the art. He explained that the modern process of enamelling glass did not produce such bright and beautiful colours as the mosaic style, when each colour was placed on a separate piece of glass. Thus the want of knowledge on the part of the former professors of the art resulted in more brilliant specimens than were at present produced when several colours were introduced on the same glass. Then it was necessary to make the drawing to be represented on the glass suitable for the work to be done, having due regard to the introduction of the leads. The lecturer explained the difference in dealing with a long single light, say 16 feet long and 2 feet wide, and a Decorated window with four lights and an elaborate tracing, and by means of illustrations showed the difficulties to be encountered. He explained the various methods of painting, and urged students of the art not to jumble up together different styles of designs, nor to use too many colours, for the simpler the colours the better. He deprecated the system of “ancienting” glass, to make the decorative work appear as if it had been mellowed by the atmosphere of ages. It might look what it represented to be just now, but in a few hundred years, instead of looking mellowed, it would be dark and unsightly.

## HOUSING OF THE WORKING CLASSES.

THE Royal Commission on the Housing of the Working Classes has issued its report relating to Scotland. Witnesses from the principal cities and towns, and from the agricultural districts, were examined. The general feeling expressed in the evidence as to the large towns is that the condition of the housing of the working classes, though in many cases deplorable, is not of the extremely miserable character described as existing in London, that efforts have been made for its amelioration not without marked effect, and that the causes of existing misery are to be ascribed as much to the habits of the people as to certain outside influences.

“The single-room system appears to be an institution co-existent with urban life among the working classes in Scotland. What in England is known as the tenement system is so firmly established that even in modern legislation the word ‘house’ is used for any separately occupied portion of a building, while the word ‘tenement’ represents the whole edifice, the English use of the terms being reversed.

“The size and height of ancient Scotch houses, in the old town of Edinburgh for instance, would be sufficient to show that they were always intended for the habitation of many families, even if this were not a well-known historical fact, though, of course, there are a good many houses which a century ago were occupied by persons in good circumstances now converted into tenement-houses (in the English sense). The system is so firmly established in Scotland that the Scotch law provides for the difficulties which may arise out of the joint-ownership of a house in portions. It is set forth in the title that necessary repairs of the roof, the drains, or the water-pipes must be borne by all the owners in certain proportions, and it is said that no practical difficulties ever arise out of the arrangement.

“It is not in Edinburgh alone that are found these large tenement-houses (the English expression is used for convenience), nor are they always ancient buildings. At Paisley they are said to be on the increase, and it seems in Scotch towns to be as usual to run up an edifice of great height, containing a number of separate dwellings, as it is in England to

build a row of two-storeyed cottages. At Glasgow it is acknowledged that an extraordinarily high proportion of its population live in single rooms, but it is said that the single rooms are much larger than elsewhere. The single-room system is an incident of the tenement system. In Edinburgh there are said to be 14,000 single-room tenements; in Glasgow 25 per cent. of the whole population live in single rooms; and in Dundee there are 8,221 houses of one room containing 22,870 inhabitants. The chief reason for this seems to be that the occupants of the single-room tenements cannot afford to pay for more accommodation. The custom of the poorer classes in Scotch towns may have something to do with their mode of life, but it is probably for the most part a question of rent. It must be borne in mind that mill girls in parties of two or three, widows, married couples with no children, and others who form a sensible proportion of those who live in single rooms, may inhabit them without harm. In Edinburgh rents seem to be very high, and consequently they bear a large proportion to wages, and are said by one witness to amount to a fourth of the wages.”

Much evidence was given by witnesses from large towns to the effect that a considerable proportion of the labouring classes in Scotland would be able to house themselves in far greater comfort if it were not for the large sums they spend in drink, and the Commissioners state:—

“The dilapidated condition of many of the habitations of the poor is another great evil. In some of the old parts of Edinburgh there are houses which are too decayed to be repaired, and the same process has taken place with regard to the inhabitants of the most miserable quarters which was noticed in the portion of the report which referred to London. When clearances have been made accommodation has been supplied for the more respectable artisans, but the poorest section of the population have been left to inhabit the defective houses which remained. Structural defects are not found solely in old quarters of the towns. At Glasgow the custom of building houses in hollow squares was said to be a great evil, and the back-to-back system in the crowded courts was described as ‘the curse of Glasgow.’ Evidence was given which showed that there is a sufficient supply of houses for the better class of the working population in Edinburgh, but that the wants of the very poor have not been met. The legal expenses, as in England, are found to be a great difficulty, especially in connection with the system of feus.”

Most of the urban witnesses spoke to an improved state of things in the towns, and the Commissioners go into details to show what work has been done to ameliorate the condition of the dwellings of the working classes. In Edinburgh the improvements have cost the city 300,000*l.*, nearly 3,000 houses occupied by the poor having been cleared away. In Glasgow 1,000,000*l.* has been spent, 80 acres have been purchased for clearance, and about 30,000 people have been displaced out of 50,000, whom it was intended to displace. At Aberdeen 800 people have been displaced, and at Greenock 2,000, houses having been provided for about 600 of those turned out. At Leith they have spent 100,000*l.* in doing so little that the Commissioners think that the Corporation should not be relieved of the obligation to carry out the scheme. At Dundee some of the worst quarters of the town have been demolished, but a good deal remains to be done. In each case the death-rate declined after the improvements had been made. In all the Scotch towns, the Commissioners remark, there seems to be a general feeling that there is no obligation to rehouse people turned out. They add:—

“Although the evidence on which the foregoing is based shows a not very desirable state of things in the housing of the working classes in the towns of Scotland, yet on the whole the only persons to whom reform might be looked for—the representatives of the more active local authorities—are not discontented with the condition of affairs. Certain amendments of the law appear to be called for. Some kind of consolidation is urgently necessary, and the introduction of a uniform system of administration in sanitary matters is required. The absence of provision in the Scotch Public Health Act of building by-laws is a considerable defect, and it is recommended that they should be made general throughout the country, where there is no private Act or Dean of Guild Court, which has a general supervising jurisdiction. Much can be done to mitigate the evil of the single-room system by raising the standard of cubic feet of air required for each individual, and by making provision that the standard shall be rigorously enforced. The regulations as to underground dwellings should also be made more stringent. The Commissioners recommend that the Burgh Police and Health (Scotland) Bill, which is now before Parliament, and which contains many provisions likely to improve the condition of the dwellings of the working classes, should be passed into law. A reform which would have a marked effect would be the reduction of the cost of the transfer of land and that of small houses, which, in connection with the feuing system, renders the building of workmen’s dwellings very expensive, and puts great difficulties in the way of the labour-

ing classes either possessing their own houses or obtaining good accommodation at a low rent."

In reference to houses in rural districts, the Commissioners found a much better state of things in the Lowlands than in the Highlands and Islands, and it is chiefly with the latter that they deal. They give the following description of the crofters' hovels, such as exist in Skye and the Hebrides:—

"Some of the so-called black houses are considered fairly comfortable, but the majority are undoubtedly confined, dark, miserable, and unhealthy. They are built by the crofters themselves without skilled labour, and without imported materials. They are constructed of blocks of stone without mortar, and are completed with turf and other materials, hastily and rudely put together. They differ very considerably in condition, according probably to the means and tastes of the occupier, the worst being found in some parts of Skye and the Island of Lewis. Some of them, for instance, have only one entrance for the cattle and the inhabitants, and have no partition between the byre, the kitchen, and the sleeping apartment—all the inhabitants, human and animal, being under the same roof in the same undivided space. Many of these houses have no windows at all, light being admitted only by the door or the aperture through which the smoke escapes, the fire being usually of peat burned on a flat stone in the centre of the house."

There are, the Commissioners say, other black houses in which there is only one door, but which contain a partition between the cattle and the human inhabitants. These may be called the improved black houses, and are the work of co-operation, more or less, between the tenant and the landlord, the tenant bearing the greater portion of both labour and cost. The white houses are, the Commissioners state, also found in the Western Highlands and Islands, but they are not peculiar to one locality. They differ from the black houses, being built partly with skilled labour and with materials imported from other districts, and are built upon a system of co-operation between the landlord and tenant. On the whole, they may be said to be half supplied by the landlord and half by the tenant, the greater portion of the expense falling on the latter. The Commissioners add:—

"The question of compensating the tenant for his share in the erection of the dwelling is, in the view of the crofters, one of the chief impediments to their undertaking any improvements in their houses. The system varies very much on different properties according to the estate regulations; but as regards the black houses, when a tenant leaves he is generally allowed to sell or take away the roof of the house, or he receives in lieu some compensation. In the case of the white houses the tenant cannot lay claim to any compensation in case of eviction or re-entry, although some compensation is frequently awarded in such cases. In that event it is almost entirely dependent upon the goodwill of the landlord, which, in the opinion of the Commissioners, should not be the case, and the amounts hitherto awarded have been regarded as not liberal."

The Commissioners call attention to another class which it would be very difficult to deal with, namely, those inhabited by the poorest class of sub-tenants and squatters. In some cases, the Commissioners state, these people are the offspring of the recognised occupiers of crofters' holdings who have remained and multiplied on the ground, either sharing the already-crowded dwelling of the head of the family, or putting up habitations in defiance of estate regulations. But the worst type is to be found among the crowds of squatters in parts of Lewis, who construct mere hovels, made, perhaps, of a few sticks and turf, without stone, and built in defiance of the estate rules, and against the orders and will of the proprietors. These people appropriate land, possess and pasture stock, but pay no rent, obey no control, and recognise little or no authority. They support themselves by casual labour and the simpler kinds of fishing, and they lead a wandering life in search of work. The chairman of the Crofters' Commission, add the Commissioners, considers that migration or emigration only can deal with this serious evil.

The Commissioners are of opinion that much good will ensue from an improved system of local government in the extra-urban parts of Scotland. They urgently recommend the constitution of larger sanitary districts, and that the local authorities should be elected by the ratepayers. They consider that if these administrative reforms were carried out many of the evils in connection with the dwellings of the labouring classes in the districts in question could not be of long continuance, as the combination of improved sanitary inspection with increased public interest in local government would tend to remedy the present deplorable state of things. Lord Salisbury did not think that the investigation of this subject was sufficiently complete to justify a recommendation by the Commissioners.

**Natives** of the new Congo State have been sent by the African Association to Antwerp, and are now busy in constructing a small settlement, called "Vivi on the Scheldt," within the precincts of the exhibition.

## TESSERÆ.

**The Royal Academy and the Institute of Architects.**

SIR M. A. SHEE, P.R.A.

I THINK that the law prohibiting any of its members belonging to any other institution or society of artists is no longer necessary in the Academy, and the Academy have long ceased to act upon its spirit. The Academy, as it was originally formed, and as it is now established, depends on the contributions of the public. It was therefore necessary to guard the institution sufficiently to prevent a decline of the funds, from a deficiency of the talent that was requisite to attract the public. It became essential, therefore, that the members of the Academy should be restricted from contributing their exertions to any other establishment. If Mr. Cockerell had become a member of the Society of British Architects, and had made no reference to the Academy, I am convinced the Academy would never have taken notice of the circumstance. But Mr. Cockerell, feeling a delicacy on the subject, applied to the Council of the Academy for advice on the occasion. The reply to Mr. Cockerell was simply this—that the Council are an executive body; they have nothing to do but to execute the laws of the institution, and conduct its affairs according to those laws. They could, therefore, only refer him to the laws of the Academy, which they conceived to be conclusive on the subject, until they were removed.

**John Van Eyck and Oil Painting.**

SIR C. L. EASTLAKE, P.R.A.

It may now be expected that some opinion should be expressed as to Van Eyck's claims to the fame of an inventor. The technical improvements which Van Eyck introduced were unquestionably great; but the mere materials employed by him may have differed little, if at all, from those which had been long familiar. The application of oil painting to figures and such other objects as (with rare exceptions) had before been executed only in tempera, was a consequence of the improvement in the vehicle. Still, if we ask in what the chief novelty of his practice consisted, we shall at once recognise it in an amount of general excellence before unknown. At all times, from Van Eyck's day to the present, whenever nature has been surprisingly well imitated in pictures, the first and last question with the ignorant has been—What materials did the artist use? The superior mechanical secret is always supposed to be in the hands of the greatest genius, and an early example of sudden perfection in art, like the fame of the heroes of antiquity, was likely to monopolise and represent the claims of many. It is apparent that much has been attributed to John Van Eyck which was really the invention of Hubert, and both may have been indebted to earlier painters for the elements of their improved process. It would be useless now to attempt to divide these claims; and although some important discoveries of the elder brother may be ascribed to the younger, it may be safely concluded that much was also due to the investigations and intelligence of the latter. The works of John Van Eyck show that he was endowed with an extraordinary capacity for seeing nature. Thus gifted, and aided by the example and instructions of Hubert, a world was opened to him which his predecessors had not attempted to represent. The same mind which was capable of receiving such impressions was also likely to devise suitable means to embody them and to extend the language of imitation.

**Contrast in Ornament.**

R. N. WORNUM.

There are two provinces of ornament—the flat and the round: in the flat we have a contrast of light and dark; in the round a contrast of light and shade; in both a variety of effect for the pure gratification of the sense of vision. In the first case a play of line is the main feature; in the second a play of masses, and colour may be an auxiliary to both, but it acts with far greater power in the flat, as it is entirely dependent on light. Ornament, therefore, is a system of contrasts; the object of study is the order of contrasts; the individual orders may vary to infinity, though the classes are limited, as sight-line or curved-line series of simple curves or clustered curves, series of mere lines or natural objects, as flowers arranged in the orders of these different series. For example, the common scroll is a series of spirals to the right and left alternately; the Roman scroll is the acanthus plant, or brank ursine, treated in this order of curved series. Such a treatment of a plant is termed conventional, because it is not the natural order of the growth or development of the plant. Where the exact imitation of the details and its own order of development are both observed the treatment is natural, and an object so treated, independent of any application, is only a picture or model, not an ornament. To be an ornament it must be applied as an accessory decoration to something else. The production and application of ornament are distinct processes, though they cannot be separated in applied design. A proper

distinction between a picture or model and an ornament is of the utmost importance to the designer, for the mere power of imitation of natural objects, and even their exact imitation, is perfectly compatible with the total ignorance of ornamental art. The great art of the designer is the selection and arrangement of his materials, not in their execution. There is a distinct study of ornament wholly independent of the merely preliminary exercises of drawing, colouring, or modelling. A designer might produce a perfect arrangement of forms and colours, and yet show the grossest stupidity in its application.

#### Art and Botany.

PROFESSOR E. FORBES.

A small amount of botanical study would prove a profitable capital to the ornamental draughtsman. Science would teach him how every stem is adapted for its own peculiar style of foliage, and how an incongruous mixture of leaves, fruits, and flowers cannot give the pleasure to the eye that, even when it is uninstructed, it so rapidly and delightfully derives from the contemplation of combinations the elements of which are truthful. The leaf of a monocotyledonous plant attached to the flower of a dicotyledon strikes the spectator who has no knowledge of botanical science as unnatural, for the eye learns, and compares, and recollects, even when the understanding is obscure and cloudy. To the botanist who sees in all the structures and stages of vegetable organisms heaven-devised beauty and the manifestation of Divine foresight and love, such mistakes become still more offensive. The mere literal copying of nature is not what is demanded; that would be contrary to nature's own plan. The value to a designer of a scientific comprehension of his models is the insight it gives him into the possible variations of the original, and the inexhaustible sources of grace and beauty, whence so much that is new and yet consistent may be derived towards the following out of nature's own idea.

#### Why Architecture Pleases.

SYDNEY SMITH.

The beauties of architecture I should conceive to be referable to the beauties of utility, of regularity, of delicacy, and of association. Why is the west window of the cathedral at York beautiful? Let us endeavour to follow what passes in the mind in looking at this celebrated piece of architecture. It is, in the first place, Gothic, and there is an association in favour of Gothic architecture; we have heard it is beautiful, and are prepared to admire it. The stonework is very light, and therefore does not obstruct the passage of the sun's rays, nor does it give us the idea of labour uselessly employed, but on the contrary the idea of delicacy, which I have before stated to be a cause of beauty. It is full of regular figures neatly cut, which it is not easy to make of stone. The whole is a regular figure, and bears a just proportion to the size of the building. As to the different orders of architecture, it is quite impossible to assent to the observations of those who would contend that their proportions are absolutely beautiful, that nature has made these proportions originally a cause of that feeling, independent of any utility to which those proportions may be subservient, and of any association with which they may be connected. The common sense of the business appears to me to be this: I see a pillar, I conceive it as erected to support something. I know the nature of stone and its strength. If the proportions are so managed that I conceive the thing to be supported will fall, it gives me the idea of weakness and frailty, which is unpleasant; if they are such as to indicate a much greater degree of strength than is wanted, then I am equally disgusted. Between these two extremes all proportions are naturally of equal beauty.

#### Historic Importance of Embroidery.

CANON ROCK.

For the genealogist, the lawyer, the herald, the historian, the reader of Mediæval poetry, such of these old liturgical garments as bear armorial charges embroidered upon them have a peculiar value and a more than ordinary interest. These emblazonries not only recall the names of persons bound up for ever with this land's history, or bring to mind some wild but graceful legend like that of the fabled swan, still borne by the baronial house of Stafford as its supporter, but may again serve as they once before have served to furnish the one lost link in a broken pedigree, or unravel an entangled point before a law tribunal. Towards the end of the fourteenth century a memorable suit was begun at Westminster by Richard Lord Scrope, in defence of his right to the arms "azure, a bend or," against the assumption of them by Sir Richard Grosvenor. Amongst the witnesses on that occasion were many people of eminence. Sir Simon Parson, of Wensley, whose fine grave-brass still in that church is given by the Brothers Waller in their beautiful work, brought forward in court an alb—a long linen kind of gown worn by priests at mass—the apparels to which were embroidered with the Scrope's arms, "azure, a bend or," of very old work. The abbot of St. Agatha's, founded by the Scropes,

near Richmond, Yorkshire, deposed that the same shield was figured upon altar frontals, upon vestments, and upon a corporax-case of silk, all belonging to that abbey church. Geoffrey Chaucer, the poet, when sworn and examined on behalf of Sir Richard Scrope, said that all his lifetime he had seen the above-mentioned arms in banners, glass, paintings, and vestments, and they were commonly called the arms of Scrope.

#### Enamel.

A. W. FRANKS, M.A.

The term "enamelling," in its widest signification, is applied to the art of ornamenting any substance with a vitreous material, to the surface of which it is made to adhere by heat; so that not only metal, but also stone, earthenware, and even glass itself, may be said to be enamelled. It is, however, more usual to restrict the term of "an enamel" to metal work ornamented in this manner, the one requisite being that the vitreous decoration shall have been fixed in its place by fusion. There are several ways of disposing the enamel. It may have been sunk into cavities, as in the encrusted processes; it may have been floated over an engraved bas-relief, the details of which are revealed through its transparent body, a mode of decoration peculiarly suitable to silver, and which has been termed translucent on relief, or by the French *émaux de basse taille*; or it may entirely conceal the metal surface, as in painted enamels. Moreover, in encrusted enamels, the cavities to receive the enamel may be either hollowed out in the metal, constituting what is termed in French *champlevé* enamel, or a *taille d'épergne*; or they may be cells composed of a kind of filigree of narrow bands of metal, which keep the colours separate, and with their edges form the outlines of the designs. This latter process is known as *cloisonné* enamel, and is peculiarly suitable to gold, though commonly applied to copper.

#### Roman and Gothic Masonry.

J. H. PARKER.

The Roman walls are often faced with brick or with ashlar in small cubes, sometimes on the exterior only, more frequently both inside and outside; but the strength of the walls does not in the least depend on the facing, and the interior is more commonly plastered only for the purpose of receiving mosaics or frescoes, or is ornamented with slabs of marble, or with stucco, or with bronze. In Rome itself and in a great part of Italy the walls are almost entirely constructed of rubble or concrete, either of broken brick or rough stone, merely faced with cut stone or marble. In England and in Gaul the Roman walls are commonly built of rough stone with grouting, but banded together with layers of tiles at short intervals; and it is evident that the Romans depended more on their tiles or bricks for the strength of the wall than on the stone, and that the facing had nothing to do with the strength of the wall. In Mediæval walls this is reversed: the strength of the walls depends upon the ashlar, and, although the grouting often becomes a concrete mass, this was usually accidental. Double walls, with passages in them, could not stand if the ashlar was removed. In some cases, indeed, where the walls were very thick and had a passage in them, and the lime, being burnt on the spot, happened to be very good, the concrete mass remained as a rock long after the ashlar had been removed, as at Reading Abbey, but this was never the intention of the builders. The double walls of the Middle Ages were intended to form one whole, and appear to us almost a necessary part of the Gothic construction, although it is certain that the walls of Gothic buildings are not always so constructed. The interior is sometimes left rough and covered with plaster, and in country churches the exterior also, the walls being built of rubble only, but the double wall is clearly the more scientific construction.

#### Mortar.

SIR R. RAWLINSON, C.E.

Mortar for sewer works in all cases should be capable of setting in water. Portland cement and lias limes make good hydraulic mortar. The proportions of cement, or of lime to sand, should not exceed two and a half of clean sharp sand to one by measure of ground Portland cement or lias lime. If clean furnace ashes or slag are available, there may be 2 of sand and one-half of ashes or slag, the whole to be mixed in a revolving pan, each pan-full to have twenty minutes grinding. When mortar is used with bricks, the beds and joints should be spread thick and full over the entire area of both bed and joint, leaving, when pressed into place, a bed and joint never less than one-eighth of an inch in thickness of mortar. In 4 cubic yards of completed brickwork there should not be less than 1 cubic yard of mortar incorporated. In making mortar or concrete, it will be of the utmost importance to use clean materials and to preserve them clean; the water used for wetting bricks and for mixing concrete and mortar must be free from silt. Concrete and mortar should also be used on clean surfaces.

## NOTES AND COMMENTS.

A DEPUTATION from the University of Aberdeen waited on Lord ROSEBERY as First Commissioner of Works on Monday, in connection with the proposed extension of the buildings, and with a view of obtaining a grant of public money for the purpose. The deputation might, however, as well have stopped at home for all they got for their pains. Rich people have always expressed the greatest willingness to help the needy, only, unfortunately for the needy, they are never in a position to do so when required. Thus Lord ROSEBERY pointed out that he only occupied a very distant outpost of the Treasury, which was the real fortress they had to storm, and, as regarded these matters, his functions were not those of the person who had to decide whether those additions should take place or not, but rather those of the plumber or glazier who, when the alterations were decided upon, was called in by the Treasury to do the work. Therefore he was afraid there was little good in convincing him. But they did not need to convince him of the great work that was being done in the University of Aberdeen, or the utility of any expenditure on Scottish education. The deputation then explained to his lordship that they understood they could not approach the Treasury without first obtaining his consent as First Commissioner of Works, otherwise they would not have plagued him. To this the Earl of ROSEBERY replied that he could not interfere—he was the plumber and glazier, no more. Lord ROSEBERY may be congratulated by his countrymen on the facility with which he has learned the amenities of the circumlocution office.

THE Russians would appear to be more at home upon the war-path than in peaceful competitions. A correspondent thus describes the Russian court at the Antwerp International Exhibition:—"The Russian section is being fitted up in a style more peculiar than beautiful. On entering it one passes from all usual style of decoration to a kind which probably owes its origin to the Tartars. The roof is supported on pillars of very irregular outline, painted yellow and red, and is covered with a light brown material spotted with purple. As yet no exhibits are to be seen in these courts in which one feels as if transported into the realms of mystery ruled over by the Czar."

THE Council of the Society of Arts state that they are prepared to award the following gold medals in connection with the International Inventions Exhibition:—Under the John Stock Trust, one gold medal, for the best application of Photography to a Permanent Printing Process, Group XXVI., Class 140; Group XXIX., Class 159. Under the Howard Trust, five gold medals, for the best exhibits (coming within the terms of the Trust) in the following classes:—One for the best exhibit in Group IV., "Prime Movers," Class 26, Steam-engines and Boilers. One for the best exhibit in Group IV., Class 27, Gas and Air Engines. One for the best exhibit in Group IV., Class 28, Means of Utilising Natural Forces. One for the best exhibit in Group XI., Classes 59 to 62. One for the best exhibit in Group XIII., "Electricity," Class 72, Distribution and Utilisation of Power. Under the Fothergill Trust, one gold medal for the most novel and best exhibit in Group XXVIII., "Philosophical Instruments and Apparatus," Classes 148 to 158, and under the Alfred Davis Trust, three gold medals to be awarded in Division II. of the Exhibition (Music), Groups XXXII. to XXXIV., Classes 166 to 180.

THE report of the Commissioners for Housing the Poor, just issued, for Scotland, states that the Corporation of Leith "borrowed 100,000*l.* for the purpose of clearing certain unhealthy areas which were said to be dangerous to the health of the inhabitants and to the town generally, but they have spent the whole of it without having begun to clear any portion of the unhealthy area except some twelve structures." This statement has been received with considerable surprise in the district, and, in commenting on it, the *Scotsman* observes that, in point of fact, the 100,000*l.* has been spent in obtaining the Act of Parliament, the purchase of the properties and leases within the area, as well as the arbitrator's fees and legal charges. Part of the loan has also been disbursed for drainage and paving opera-

tions, and the only reason that has prevented the Local Authority from making further clearances in the unhealthy areas is the provision in the Artisans' Dwellings Act which requires that houses for the working classes occupying the areas should be built "simultaneously" with the taking down of the old tenements. The Local Authority, consequently, first cleared area D, so as to open up and make approaches to the unhealthy areas; and until this ground is feued it would appear to be unnecessary, and in violation of the letter if not of the spirit of the Act, to demolish any habitable buildings in the other areas. The Commissioners also state that they "cannot recommend that the Corporation of Leith should be relieved from the obligations imposed upon them by law." This would appear to mean that the Corporation should be compelled to provide houses for the 3,505 persons who occupied the Improvement Scheme area when the Act was passed. At present there are 743 houses of 15*l.* rental and under standing empty in the burgh outside the area, while within the area the Local Authority have 69 unlet houses fit for habitation. In such circumstances, it is not to be expected that builders will feu ground for erecting additional houses.

To submit a work of art for exhibition at Burlington House may be compared to taking part in a game of hazard. But the gamester, though he hopes to win, knows that he stands the chance to lose. But artists, we opine, send their works to the Academy under the impression that at any rate, if not placed with infallible perfection of judgment, they will not be so placed that it would be better they had not been sent for exhibition at all. Mr. THOMAS WOOLNER, R.A., was entrusted with the execution of a statue, subscribed for by many friends of the late Lord FREDERICK CAVENDISH, to be placed as a monument to his memory in Cartmel Priory Church. In connection with this Mr. WOOLNER writes:—"Thinking that the subscribers would be interested in seeing the work, I obtained permission from the family to exhibit it at Burlington House. There, owing to the direction of the light, I found the statue so placed that neither likeness nor workmanship could be seen. I wrote to the authorities asking that the statue might be turned at a right angle to its present position, and have received a reply that the Council are unable to comply with my request 'as it would interfere with the whole arrangement of the room.' Considering that there are 138 works in the room, and that turning my figure round would interfere with no other work, your readers may judge the value of the reason given. As I am unacquainted with the subscribers, I adopt this method of telling them that the statue of Lord FREDERICK CAVENDISH cannot be fairly seen as it is now placed in Burlington House, the effect of my statue being as completely marred by an excessive glare of light as it would be by darkness itself."

WEDNESDAY was the first day for the reception of exhibits for the Artisans' Exhibition in Dublin. Along with the exhibition of Irish Industries the Fine Arts will be represented. A specially-constructed brick edifice has been prepared at the western side of the building for the Fine Arts collection, there being in this section more than 120 distinct entries, including several high-class paintings at present in the Royal Hibernian Academy, and a number of valuable works by Irish artists, the property of various ladies and gentlemen throughout the country, who have lent them for the occasion. Carved and other woodwork will be one of the notable features of the exhibition, including statues and altars in bog-oak, artistic domestic furniture, and other carved woodwork. There will be models of artisans' dwellings with garden, iron conservatory and bent-glass roof, American Swiss cottages, with apartments, labourers' houses, detached dwellings showing a perfect sanitary system, artisans' cottages, and two-storey houses in country and city. In the section for gold, silver, and precious stones, of which Dublin contributes the major part, there will be a series of designs for Irish medals, samples of jewellery manufacture, specimens of gold and silver engraving, and ecclesiastical art metal-work in gold, silver, and brass. Among the metal-work there will be other expositions of church art-work, specimens of hand-made *repoussé* brass-work, engraved brass tabernacle door, designs for iron balconies, wrought-iron tables, brasswork, &c.

## ILLUSTRATIONS.

THE ARTS: THE POTTER.

THIS illustration is the third of the series by Monsieur EHRMANN.

SKETCHES IN ITALY.

THESE sketches are by Mr. REGINALD BARRATT, and from drawings in pencil similar to those in the Royal Academy.

BUSINESS PREMISES, SOMERS TOWN.

THE accompanying illustration bearing the above title represents a block of buildings erected a short time ago at the corner of Church Way, Somers Town, and forming one of the numerous well-known grocery establishments of Mr. GEORGE CARTER. The end gable shown in the view indicates the width of only the narrowest part of the premises. The depth, at the other extremity, from the front to the back of the main building is 36 feet; and the ground and outbuildings in the rear extend 21 feet further back still.

The ground-floor storey is chiefly occupied by the shop. The basement and first floor are, for the most part, used for the storage of goods, which can be readily hoisted and lowered by means of a large lift, so arranged as to be directly accessible from the street, where the vans take up and deliver. The top storey consists entirely of rooms set apart for the accommodation of Mr. CARTER'S employes.

The front walls are faced with yellow malms. The bands are formed in Loughborough red bricks, the arches constructed in Reading bricks rubbed and gauged, and the stone dressings principally executed in Ancaster stone.

The work generally was carried out by Mr. W. ROYAL, from the designs and under the direction of the architects, Messrs. SAVILLE & SON. The balcony railings and other ornamental ironwork were executed by Mr. J. STONE, of Southwark, and the tiling in the window-heads by Messrs. MINTON & CO. The total expenditure was about 2,000/.

MORTUARY AND CORONER'S COURT, ST. PANCRA'S.

THE invitation to submit designs for these buildings was responded to by thirty or more architects, and, after considerable delay, the vestry have selected the plans sent in by Mr. EGGAR. Mr. A. W. SAVILLE (two of whose drawings we now publish) obtained the second highest number of votes, and Mr. H. H. BRIDGMAN came next.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE eleventh ordinary meeting of the Institute of Architects was held on Monday evening, Mr. Ewan Christian, President, in the chair.

It was announced that the Institute had lost an honorary member by the death of Sir Watkin William Wynn.

## Roman Remains in Algeria

Mr. ALEXANDER GRAHAM read an elaborate paper on "The Roman Occupation of North Africa, with special reference to the Remains in Algeria." He referred to the country as offering a great field for antiquarian research, from early times down to the Arab occupation, for the primitive races who had succeeded each other in turn had all left innumerable records of their presence, and the history of the country might be literally said to be written in stone. He also referred to the great value of the numerous inscriptions, affording abundant material for a history of North Africa. Ancient writers did not furnish much reliable information about the towns, either Phœnician or Roman, nor was their knowledge personally acquired. Among the travellers not one had been a painter or an architect; nevertheless, the eighteenth century travellers threw great light on the whole subject. But our indebtedness, as architects, was greater to Bruce than to any other explorer, on account of his careful drawings of some of the principal monuments, his familiarity with architectural knowledge, and his critical notes.

No continuous history of the country was recorded by its monuments. We found no Phœnician architecture or industrial art worthy of imitation, though it was deserving of study in connection with the development of the Roman work. Temples and stately edifices adorned the city of Carthage, but

the architecture was Greek work and not Punic. On the other hand, the Phœnicians were great in the art of navigation and water supply, which was the sole heritage the Romans received from them.

The author next alluded to illustrated and other works by French travellers and their general excellence, and then proceeded to explain the boundaries of the country known to the Romans as North Africa at the close of the third Punic war, showing how it was divided and what races inhabited it. The rise and progress of the Carthaginians were traced to their final subjection to Rome, reference being made to the apparent absence of any influence exercised by Carthaginian over Roman art. The spread of the Roman colony was followed from the sea to the desert, as evidenced by inscribed stones that strew the surface in every direction, sometimes where least expected. These stones form the real history of the country. There is a difficulty in assigning a precise date to some of the principal monuments on account of the fragmentary condition of inscriptions, but the reign of Severus may be credited with the largest number; a remark followed by an extract from M. Choisy's work entitled "L'Art de Bâtir chez les Romains," explaining how the building art under the Empire made rapid advances, while Classic architecture, as an art, was declining. The author referred to a map, showing all the principal towns in the colony of North Africa in the age of the Antonines, supplemented by a tabulated list of the principal cities, distinguishing the *coloniæ* from the *municipia*. Then, starting from the eastern frontier of Algeria, that corresponded very nearly with the old boundary between Numidia and Africa proper, he tracked the Romans along the coast, and then into the plains to the slopes of the Aurès down to the military posts in the great desert. Passing by Hippone, which has little left to interest us except as the scene of the labours of St. Augustin, the author touched at Rusicada, a place of considerable importance, judging from the numerous remains found there, drawings of the most important being exhibited on the wall. Then passing Saldæ and Iconium with slight reference, he gave a full account of Julia Cæsarea, the capital of Juba II., saying a few words about this remarkable man and all that he did to beautify the city of his choice. The author alluded to Tipasa, and gave a brief description of the few Roman remains to be found further westward. Allusion was made to the marble quarries of Numidia, and a brief account given of the principal marbles of North Africa, still to be obtained in large blocks and at a reasonable price. Returning by Sitifis, in the plains, the author described the principal monuments at Cuiculum, and gave a full account of the remarkable mosaics discovered at Oned Almenia, giving a little insight into the country life and habits of the Romans in the fourth and fifth centuries, and showing, by reference to inscriptions, how much encouragement was given by the emperors to the breeding and training of Numidian horses for the circus at Rome. A few words sufficed for a description of Cirta, the remains of the great Roman Bridge there over the Roumel, and the tombs of Præcilius the silversmith, and of the family of Lollius. Then passing southward by the ruined monument known as Es-Soumah, the author described the principal remains of Tibilis and of the important town of Calama, referring also to the sites of Khamisa and Medauri, which as yet have only been partly explored. Journeying southward a description was given of the remarkable city of Lambæsis, with its forty triumphal arches, its great establishment for an entire military legion, and of the many objects of interest still to be seen in the museum there. Passing by Verecunda, the author gave an account of the ancient Thamugas, at the foot of the Aurès, describing the beauty of its situation and the striking character of some of the monuments, referring to the city as the Pompeii of North Africa. Continuing along the northern slopes of the mountains, the author gave a brief history of the ancient Theveste, its remarkable quadrifrontal arch, its little temple of Minerva and the ruined basilica of Vespasian's time that had been converted in the sixth century into a Christian church. Passing over the Aurès, the author completed his account of the Roman occupation of this part of the country by referring to the military posts far down in the desert. The value of these monumental remains was then considered, the author endeavouring to show that although the triumphal arch, the great Thermæ, the basilica, and even the colonnade of the Roman are now no longer needed, yet the spirit that prompted these works is with us still, evidenced in a measure by our language, our literature, our laws, and even our festivals and calendar, concluding with a remark that, as citizens as well as architects, a study of the works of the Romans was of value as well as of exceeding interest.

Professor T. HAYTER LEWIS proposed a vote of thanks to Mr. Graham for his paper and the magnificent series of drawings with which he illustrated it. Northern Africa, though comparatively so near us, might be said to be an unknown land. No one visited it. There was a fascination about Palestine, Greece, &c., which did not attach to North Africa. They had illustrations, of course, and Bruce had drawn profusely;

but such drawings as Mr. Graham showed that evening were, he thought, without parallel, and of absolute interest to architects, be they who they might. Mr. Lewis then commented on the work in relation to architectural and artistic results, and controverted the idea that the Phœnicians had not practised in architecture and art of a high description, and called to mind that Solomon in his grandest work had called in a Phœnician architect, Hiram, which would hardly have been the case had the Phœnicians not been great artists.

Mr. J. J. WOOD seconded the vote of thanks.

Mr. PERCEVAL said Mr. Graham was right in saying that the North African coast abounded with interesting studies of architecture. Everywhere the most interesting Phœnician remains were found. What had struck him most in that region was the wonderful wealth of marbles, a most marvellous variety of which were found over the whole of Tunisia.

The vote was carried by acclamation.

Mr. GRAHAM, in responding, mentioned that a Belgian company was now working some of the old quarries containing the most exquisite marbles, and it was their intention, he was told, to have a dépôt in London. Consul-General Playfair was going to read a paper on these marbles at the congress of the British Association in Aberdeen.

### EDINBURGH ARCHITECTURAL ASSOCIATION.

THE members of the Edinburgh Architectural Association visited Borthwick and Crichton Castles on Saturday afternoon. While taking shelter at Fushiebridge Railway Station during a thunderstorm, the president (Mr. G. Washington Browne) gave a historical sketch of Borthwick Castle. Subsequently the members proceeded to Borthwick, and Mr. Browne conducted them over the castle, and described the peculiarities of plan, showing how they conduced to the external effect. It was pointed out how the appearance of power and grandeur was caused by the great mass of plain mason-work emphasised by the smallness of the window openings, and how, in spite of the smallness of these openings, the apartments were perfectly lighted. The great hall, although measuring 50 feet by 23 feet with a height of 28 feet, and having no more light than would be afforded by an ordinary oriel window, was yet, owing to the skilful distribution of the window openings, quite sufficiently clear. General regret was expressed at the faulty state of the castle roof, which threatens its durability. The party afterwards proceeded to Crichton Castle, where a paper was read by Mr. John Kinross, giving the signification of the name Crichton, and a history of the different members of the Crichton family, and other families to whom the castle had belonged. The various features of the castle—the great hall, the small kitchen of the old keep, the large kitchen with its double-arched fireplace, the upper kitchen with its access by an external balcony to the upper hall, the elaborate fireplaces, and the rich and unique decoration of the eastern side of the courtyard—were all examined with interest. The excursionists returned to Edinburgh by the late train.

### COSTUME BALL.

THE Royal Institute of Painters in Water-Colours gave on Tuesday night their grand costume ball. It was intended to give a "house-warming" fête of this description as soon as the new galleries in Piccadilly were in order, but last year the plan was prevented by the death of the Duke of Albany. The greatest pains had been expended on making the ball as characteristic and interesting as possible. Every guest was expected to attend in "a costume of a historical period before 1837," which of itself would insure some difference between this and ordinary fancy-dress festivities; but the feature of the evening was the "Masque of Painters," a series of tableaux illustrating the history of art from the time of Phidias to that of Sir Joshua Reynolds. Ancient Athens, Florence, Rome, and Venice, the Germany of Dürer and Holbein, the France of Francis I., the Madrid of Velasquez, the Holland of Franz Hals and Rembrandt, and, lastly, a comprehensive view of the art of England from the days when Vandyck painted the King and Queen to those of Reynolds and Angelica Kauffmann, were represented in successive tableaux; while explanatory verses were recited by Virgil, called up for the occasion from the *Shades* to act as Chorus. The artists who were chiefly responsible for the tableaux were (1) Mr. Sacheverell-Coke, (2) Mr. Walter Crane, (3) Mr. J. D. Linton, (4) Mr. Caton Woodville, (5) Mr. Seymour Lucas, (6) Mr. T. W. Wilson and Mr. E. A. Abbey, (7) Mr. Seymour Lucas and Mr. Charles Green. The verses were written by Mr. Edmund Gosse, in a manner pleasantly recalling the masque-writers of the seventeenth century, and Virgil was personated by Mr. J.

Forbes-Robertson. About ten the tableaux began. The curtain rose to discover an altar, beside which Virgil stood in scarlet robe with a crown of laurel on his head and a staff in his hand. He described how his sacred slumbers had been disturbed by the blare of trumpets, and how he had come forth by Athene's will to explain the pageantry which was to unfold the "pedigree of art." First were to come some "shadowy names from fair historic Greece;" and accordingly, when the curtain had fallen and risen again, there was revealed part of a street in Athens, with scaffolding raised against a building, where, among loose blocks of marble in the foreground, Pericles (Mr. John Fulleylove) was consulting Ictinus, the architect (Mr. H. M. Paget), and Phidias, the sculptor (Mr. John Nettleship), respecting the details of the Parthenon. Zeuxis (Mr. John Scott) was seen on the left hand in converse with some Athenian ladies. This scene over, Virgil appeared again, and described how ages had passed, and how there stood before him the new glories of Italy, of Florence, Rome, and Venice.

No names so great as these the ages know—  
Da Vinci, Raphael, Michel Angelo;  
All skill, all grace, all power of hand and heart,  
These mighty three combined 't enrich their art;  
And till the tired world sinks within the sea,  
No fourth shall rise to breast the immortal three.

This was Mr. Walter Crane's tableau, and he had ingeniously divided the inner scene into three arched compartments, so as to display, as in a triptych, the arts of the three great Italian cities. In the centre, in a Florentine garden, behind which rose the tower of the Palazzo Vecchio, there appeared Dante and Beatrice, Petrarch and Laura, Cimabue (Mr. Walter Crane), with Giotto as a shepherd boy, and Niccolò Pisano (Mr. W. A. S. Benson), with various ladies of Florence, chief among whom was Boccaccio's Fiametta (Miss Stillman). In the right hand compartment was a terrace in the gardens of the Vatican, where Michel Angelo (Mr. John O'Connor) was showing to Pope Julius II. (Mr. S. Sidley) an architectural design. Cardinals and priests were in waiting on His Holiness, and Raphael (Mr. E. R. Hughes), at the foot of the steps in front, looked upon his great rival. On the left was a glimpse of Venice from a balcony of the Ducal Palace. A group of gentlemen and ladies of the Giorgione period were standing there, and there were also Giovanni Bellini (Mr. Lewis Jarvis), Titian (Mr. J. H. Mole), and Paul Veronese (Mr. J. D. Linton).

The next tableau was Mr. Linton's arrangement of the representative characters of the age of Dürer and Holbein. It displayed the interior of a studio in which Albrecht Dürer (Mr. E. J. Gregory, A.R.A.) was explaining to the Emperor Maximilian (Mr. R. J. Stock) his print called the *Triumph* of that potentate. In the group supporting the Emperor were Holbein (Mr. H. Stevens), Peter Visscher (Mr. James Orrock), and Lucas Cranach (Mr. E. M. Wimperis). Then the audience was invited to pass to France, to dwell for a moment on the period when, as the historian of the French Renaissance has expressed it, "the shattered remains of Italian civilisation might be collected, and Paris might receive the men whom Italy could no longer employ;" when France, having sucked the life-blood of Italy, was to derive new life from the death of her teacher. Virgil here recited these lines:—

To that pale Court where passion burned in flame,  
With silver gifts and bronze, Cellini came;  
There, chained to pleasure, art and beauty lay,  
And all the Pleiad with their crowns of bay;  
At Francis' feet the mighty Potter laid  
The coloured fish and snakes and weeds he made,  
And round them, wondering, those French faces drew  
That Clouet's brush and Goujon's chisel knew.

The scene, designed by Mr. Caton Woodville, represented a terrace in front of the Palace of Fontainebleau, Francis I. (Major Wallace Carpenter) receiving Benvenuto Cellini (Captain A. Hutton), who was taking specimens of gold and silver plate from his pupils, Paolo Romano (Mr. F. Verrall) and Ascanio da Tagliacozzo (Hon. Duff Tollemache), and presenting them to the king.

Then followed the "starv'd and short" day of painting in Spain. The tableau represented the studio of Velasquez (Mr. Cafe), in Madrid, on the occasion of a Royal visit. The master was pointing out to King Philip IV. (Mr. Haynes Williams) and Queen Mariana (Miss Day) his picture of *Las Meninas*, which stood upon an easel, and other Dons and Doñas, painters, and Cardinals stood around. Then came Holland, and

The Dutch, when wealth and wisdom clipped their wings,  
First learned the loveliness of homely things,  
But looked beyond, for Rembrandt trained their eyes,  
And marked the changes of their northern skies;  
Then silvery Terburg came, and golden Cuyp,  
And each flushed votary of the pot and pipe.

The scene represented an old Dutch house and garden in Haarlem, once the home of Franz Hals and of Jan van der

Meer. On the right were a group drinking and talking around a table, Rembrandt lifting his glass to Cuyp; Ostade and Teniers watching a game of bowls. Then, after more verses from Virgil, came the elaborate tableau of Mr. Seymour Lucas and Mr. Charles Green, intended to represent the history of art in England for more than a hundred years. A hemicycle, in pyramidal shape, rose between columns. At the summit stood Charles I. (Mr. Arthur Lucas) in hunting costume, and Queen Henrietta Maria (Miss Florence Cotton) sat just below, watching Vandyck (Mr. Alfred Mason) painting the portrait of the king. Behind the queen stood Prince Rupert (Mr. Arthur Hacker), and, on successive steps, broadening to the base, were Hogarth (Mr. C. M. Barker), standing a little aloof from the others, Sir Joshua Reynolds (Mr. R. R. Collins), conversing with Angelica Kauffmann (Miss Alma-Tadema), and Gainsborough (Mr. W. S. Stacey).

After Virgil had declaimed a few more graceful verses, the characters filed off the stage two and two, and passed up into the picture galleries, the Royal party and the other guests following, and remaining there till the hall was cleared, when dancing commenced.

## THE CRYSTAL PALACE PICTURE GALLERY.

THE whole of the pictures in the art gallery at the Crystal Palace having been sold at the close of the International Exhibition held there last year, the directors have converted the one long gallery into a range of conveniently sized rooms, the cross divisions, of course, affording much additional wall space. In these well-lighted galleries there have been arranged, under conditions on the whole favourable to the works exhibited, a collection of oil-paintings and water-colours, of which a considerable number are pictures for which space could not be found, although their merits would in many cases have entitled them to a place, at the Royal Academy or the Royal Institute of Painters. Gallery I. is filled with works, 127 in number, which may be considered as an overflow from those two exhibitions. Gallery II. contains, among other water-colours that will attract notice, two by Mr. John Absolon, R.A., the very interesting original studies for Mr. G. A. Storey's *Blue Girls of Canterbury*, two architectural studies by Mr. Macquoid, and a pleasing portrait by Miss Catherine J. Atkins. In Gallery III. are about eighty oil-paintings from the Academy, of which two by Mr. Lester Sutcliffe, a warm-toned autumn scene and a well-composed seascape with rocky foreground; a landscape with a group of cattle by a reedy pool, sent by Mr. Marmaduke Langdale; a sunset after storm, somewhat suggestive of Danby, by Mr. G. A. Williams; and a mountain loch, by Mr. C. Gordon Stuart, must be mentioned. The next room also contains oil-paintings, of which some have been hung at the Academy, Mr. Stanley Berkeley's *Prince Rupert* being one of these. Two sea pieces by Mr. Calcott are good specimens of his broad and nervous style. Gallery V. is given up to architectural drawings and works by students of the Crystal Palace School of Art. The galleries have been adorned with statuary and groups of foliage plants; and, as the important matter of providing seats for visitors has not been overlooked, the new picture gallery may be expected to prove a popular addition to the attractions of the Palace, especially as no extra charge is to be made for admission.

## LIVERPOOL ARCHITECTURAL AND ENGINEERING SOCIETIES.

A JOINT meeting of these Societies was held on Wednesday, May 13, at the rooms of the Architectural Society, 9 Cook Street, Liverpool, when a paper by Mr. W. Goldstraw, on "Science and Art in Connection with Building," was read by the author. The paper referred to the connection of science with building as "the application of exact knowledge of the nature of materials, and of the principles of mechanics to the planning and construction of buildings with a view to their safe and convenient use," whilst the connection of art with buildings was said to be "the exercise of taste and skill in both design and execution for the purpose of producing a beautiful effect in the structure." Thus regarded, science and art, or utility and beauty, ought to be amalgamated in building work without neutralising each other, and the balancing of the two was the problem which every designer of buildings should endeavour to solve. For examples of this happy union, reference was made to the dome of St. Paul's, the steeple of Bow Church, the Vienna Exhibition, and the arched vault over St. George's Hall. As instances where science had excluded art, mention was made of the Britannia Tubular Bridge and the new Tay Bridge. The man whose chief business it is to apply science to buildings is an engineer, but the architect must cultivate science and art together. The distinction between the two professions was

described as very much an arbitrary one. Neither engineers nor architects have any exclusive right to the work of designing buildings and such like structures. There is no line of demarcation between the two professions. But there is a bond of union in the nature of their common pursuits.

## ANCIENT ROMAN ROAD.

THE fact that no trough-stone has been hitherto met with in any undoubted Roman road in the country can no longer be maintained, owing, says a correspondent, to a discovery which has been made by Mr. Edward Kirk, of Pendleton, in a portion of the Roman road which united Chester and Manchester. The site of these remains is in Delamere Forest, and near to the ruins of the Castle of Eddisbury. The road at this point was through what has been a natural mound, and the course had to be excavated through the red sandstone. The road ascends in an easterly direction a gradient estimated at about one in fifteen. The earth and rock have been cleared to the depth of 12 feet or 15 feet, and to the width of 35 feet. Up the centre of this 35 feet roadway is cut through the solid rock, with a trough in the middle resembling the one on Blackstone Edge in its main features, being in one measured section 22 inches wide at the top and sloping to 15 inches at the bottom. On each side of this trough has been cut a rut for the wheels of vehicles to pass along. These are 11 inches wide at the top and 7 inches at the bottom, one being a foot deep. The sides of the ruts next the trough are perpendicular; the outer sides form a gradual slope. The rigid straightness of these ruts and the perfect evenness of the slopes, as well as tool marks, show that they have been hewn out of the rock, and are not the result of wheel wear. Moreover, in one portion of the roadway it is sunk deep into the rock, having sloping sides and giving a width of 6 feet 3 inches. Taking 3 inches from the inner side of each of the ruts, which is about the centre, gives a gauge of 4 feet 6 inches, and is the same gauge as that traced in the roadway on Blackstone Edge. The length of the cutting through the rock is 207 feet. The roadway is traceable further eastward, moving on rectangular lines, and in the space of half a mile several angles are shown, one of these being nearly midway in the rock cutting. A portion of the road east of the rock cutting is a sunken way followed by an agger raised a few feet to carry it over a low place. In another portion there is a section of probably 400 yards in length raised on an embankment estimated at one point at 9 feet high. This measures from fosse to fosse 67 feet 6 inches, and the agger 31 feet.

On Saturday afternoon the members of the Lancashire and Cheshire Antiquarian Society, under the leadership of Mr. E. Kirk, visited Delamere for the purpose of inspecting the remains. Mr. Kirk said he was not prepared to read a paper, as his investigations were not yet complete. Mr. W. Thompson Watkin had visited the place with him, and they had together given a closer examination of the road than had been possible for the members that afternoon. Mr. Watkin fully concurred in his view that the remains were Roman. Dr. Colley March said what they had seen was highly interesting. The castle, they knew, had been held by the Saxons, and he thought it was clear also by the Celts, and he believed by the Romans as well. The other remains were clearly of high antiquity. The road was not, apparently, made for pack horses, but for wheeled vehicles. The ruts did not look as if made by Saxon wheels, which had broad tyres, but by narrow wheels shod with iron, with a gauge similar to the Roman gauge. The traffic had apparently been heavy, and had extended over a considerable period of time, and he was therefore disposed to refer to Roman times for an explanation. With regard to the trough, he was not prepared to say that it was the same as that on Blackstone Edge; and the ruts, he thought, might possibly have been worn by heavy traffic, and not cut. It was premature, however, to come to conclusions on some points. The Rev. E. F. Letts thought much rested on conjecture. He could not understand why the Romans should make four or five angles within so short a space. Supposing this to have been a road two hundred or three hundred years ago, he asked would not the tumbrels be sufficient to form the ruts? With regard to the ridges, they seemed to him to be nothing more than natural formations, and different colours of soil might be found in the same field. He advised caution before coming to conclusions. Mr. Kirk, in reply, said that differences of opinion were to be expected. None of them would question Mr. Watkin's ability in Roman matters. He had had a communication from Mr. Watkin that morning, in which he said:—"Thinking over the forest road, I have gradually come to the conclusion, from its low position (for the short distance), that it was first a British trackway, afterwards adopted by the Romans." Mr. Kirk said that what they had seen was contrary to all his experience in natural formations, and concluded by proposing that the society should communicate with the Commissioners of Woods and Forests—

the remains being on land belonging to the Crown—and ask permission to excavate the rocky way through “The Urchin’s Kitchen.” They should also ask for the future protection of the road.

### GLASGOW ARCHITECTURAL ASSOCIATION.

ON Saturday afternoon the members visited some of the buildings of architectural interest and importance in Edinburgh—the new Conservative Club, the Medical Schools (of both of which Dr. Rowand Anderson was the architect), and then the Drumsheugh Baths. These last, for colour and novelty of design, were specially admired. Messrs. Burnet & Son, Glasgow, were the architects. After dining together, the party visited the Royal Scottish Academy Exhibition.

### MOHAMMEDAN ARCHITECTURE.

A MEETING of the Edinburgh Architectural Association was held on Monday evening in the Professional Hall, George Street, Edinburgh, Mr. G. Washington Browne in the chair. Dr. James Burgess, F.R.G.S., Government Archaeological Surveyor for Western India, described the Mohammedan architecture of Gujerat, which he illustrated by a numerous series of drawings and photographs, showing the architecture of Gujerat, under the dynasty of the Ahmad Shahi kings, from 1397 to the middle of the sixteenth century. He drew particular attention to the mosque, which, he said, originated very simply. It was formed of a wall with recesses, in which the Mohammedan knelt or bowed, always directing his face towards Mecca. The roof was added to protect the worshipper from the sun and rain, and the marks on the wall before which he knelt were afterwards developed into richly ornamented recesses called miherabs. Turrets were afterwards built, and these, with the miherabs, were the features which were the most highly-ornamented of the Gujerat mosque. The lecturer next directed attention to the sluices for filling artificial tanks or lakes, which were ornamented in a style of surpassing richness. Examples were given of step-wells, with long descending stairs and galleries, finely sculptured and of great interest from an architectural point of view. With Mr. Ruskin and Mr. Poynter, they might, he said, regret that the time had passed when every workman was also an artist, and the dead uniformity of machine work was almost undreamt of. They could not bring back that time, but they might, like the Americans, keep it in remembrance by copying their designs in our furniture and wainscotings. Dr. Burgess, who was cordially thanked for his lecture, has consented to exhibit his collection of high-class drawings to the public of Edinburgh in the course of a few weeks.

## Bygones.

“Antiquity after a time has the grace of novelty.”—HAZLITT.

### ADDISON IN ITALY.

IN 1699, Joseph Addison having obtained a pension from the Whig Ministers for the purpose of enabling him to travel, left England for Italy. After spending over a year in France in order to acquire a sufficient knowledge of the language to qualify him for diplomatic employment, he set out from Marseilles to Genoa in a small tartane. He encountered danger in one of the Mediterranean squalls, and was compelled to land at Monaco. The voyagers tried to creep along the shore in a little boat, but the roughness of the sea made them land at Savona. From thence they travelled over very rugged mountains and precipices to Genoa. The city was at that time ruled by the Doge and nobles, whose names were recorded in the golden book. Addison gives the following description of the city as it appeared in the beginning of the eighteenth century:—

“There are a great many beautiful palaces standing along the seashore on both sides of Genoa, which make the town appear much longer than it is to those that sail by it. The city itself makes the noblest show of any in the world. The houses are most of them painted on the outside, so that they look extremely gay and lively; besides that they are esteemed the highest in Europe, and stand very thick together. The New Street is a double range of palaces from one end to the other, built with an excellent fancy and fit for the greatest princes to inhabit. I cannot, however, be reconciled to their manner of painting several of the Genoese houses. Figures, perspectives,

or pieces of history, are certainly very ornamental as they are drawn on many of the walls, that would otherwise look too naked and uniform without them. But, instead of these, one often sees the front of a palace covered with painted pillars of different orders. If these were so many true columns of marble set in their proper architecture, they would certainly very much adorn the places where they stand; but as they are now, they only show us that there is something wanting, and that the palace, which without these counterfeit pillars would be beautiful in its kind, might have been more perfect by the addition of such as are real. The front of the Villa Imperiale at a mile distance from Genoa, without anything of this paint upon it, consists of a Doric and Corinthian row of pillars, and is much the handsomest of any I there saw. The Duke of Doria’s palace has the best outside of any in Genoa, as that of Durazzo is the best furnished within. There is one room in the first that is hung with tapestry, in which are wrought the figures of the great persons that the family has produced; as perhaps there is no house in Europe that can show a longer line of heroes that have still acted for the good of their country. Andrew Doria has a statue erected to him at the entrance of the Doge’s Palace, with the glorious title of Deliverer of the Commonwealth; and one of his family another, that calls him its preserver. In the Doge’s Palace are the rooms where the great and little council, with the two colleges, hold their assemblies; but as the state of Genoa is very poor, though several of its members are extremely rich, so one may observe infinitely more splendour and magnificence in particular persons’ houses than in those that belong to the public. But we find in most of the states of Europe that the people show the greatest marks of poverty where the governors live in the greatest magnificence. The churches are very fine, particularly that of the Annunciation, which looks wonderfully beautiful in the inside, all but one corner of it being covered with statues, gilding and paint.”

From Genoa, with its sea without fish, land without trees, and men without faith, Addison travelled by road to Milan, stopping on his way at Pavia. At that time everything Gothic was held in disesteem, and, as will be seen, the traveller was not impressed by the cathedral:—

“I could not stay long in Milan without going to see the great church that I had heard so much of, but was never more deceived in my expectation than at my first entering; for the front, which was all I had seen of the outside, is not half-finished, and the inside is so smutted with dust and the smoke of lamps that neither the marble nor the silver nor brasswork show themselves to an advantage. This vast Gothic pile of building is all of marble, except the roof, which would have been of the same matter with the rest had not its weight rendered it improper for that part of the building. But for the reason I have just now mentioned, the outside of the church looks much whiter and fresher than the inside; for where the marble is so often washed with rains it preserves itself more beautiful and unsullied than in those parts that are not at all exposed to the weather. That side of the church, indeed, which faces the Tramontane wind is much more unsightly than the rest, by reason of the dust and smoke that are driven against it. This profusion of marble, though astonishing to strangers, is not very wonderful in a country that has so many veins of it within its bowels. But though the stones are cheap, the working of them is very expensive. It is generally said there are eleven thousand statues about the church; but they reckon into the account every particular figure in the history pieces and several little images which make up the equipage of those that are larger. There are, indeed, a great multitude of such as are bigger than the life. I reckoned about two hundred and fifty on the outside of the church, though I only told three sides of it, and these are not half so thick set as they intend them. The statues are all of marble, and generally well cut; but the most valuable one they have is a *St. Bartholomew*, new-flayed, with his skin hanging over his shoulders. It is esteemed worth its weight in gold. They have inscribed this verse on the pedestal, to show the value they have for the workman:—

‘Non me Praxiteles, sed Marcus finxit Agrati.’

(‘Lest at the sculptor doubtfully you guess,  
’Tis Marc Agrati, not Praxiteles.’)

Addison’s route was by Verona and Padua to Venice. He gives the following description of the Queen of the Adriatic:—

“Venice has several particulars which are not to be found in other cities, and is therefore very entertaining to a traveller. It looks at a distance like a great town half floated by a deluge. There are canals everywhere crossing it, so that one may go to most houses either by land or water. This is a very great convenience to the inhabitants, for a gondola with two oars at Venice is as magnificent as a coach and six horses with a large equipage in another country; besides that it makes all other carriages extremely cheap. The streets are generally paved with brick or freestone, and always kept very neat, for there is no

carriage, not so much as a chair, that passes through them. There is an innumerable multitude of very handsome bridges, all of a single arch, and without any fence on either side, which would be a great inconvenience to a city less sober than Venice. One would indeed wonder that drinking is so little in vogue among the Venetians, who are in a moist air and a moderate climate, and have no such diversions as bowling, hunting, walking, riding, and the like exercises to employ them without doors. But as the nobles are not to converse too much with strangers they are in no danger of learning it, and they are generally too distrustful of one another for the freedoms that are used in such kind of conversations. There are many noble palaces in Venice. Their furniture is not commonly very rich, if we except the pictures, which are here in greater plenty than in any other place in Europe, from the hands of the best masters of the Lombard School, as Titian, Paul Veronese, and Tintoret. The last of these is in greater esteem at Venice than in other parts of Italy. The rooms are generally hung with gilt leather, which they cover on extraordinary occasions with tapestry and hangings of greater value. The flooring is a kind of red plaster made of brick, ground to powder, and afterwards worked into mortar. It is rubbed with oil, and makes a smooth, shining, and beautiful surface."

(To be continued.)

### COAL TAR COLOURS.

AT the meeting of the Edinburgh Association of Science and Art on Monday night, Mr. John Ritchie, the president, in the chair, Mr. W. Ivison Macadam delivered a lecture on "Recent Advances in the Chemistry of the Coal Tar Colours." After referring to the proportions of naphthas which might be expected from coal, and to the methods by which they could be converted into the aniline series of colours, he dealt with the carbolic, naphtholine, and alizarine series. In conclusion, he explained the preparation of artificial indigo, which was the latest addition to the series, and drew attention to the chemical constitution of the various classes, pointing out the close resemblance they bore to one another. The lecture was illustrated by experiments, and at the close Mr. Macadam was awarded a hearty vote of thanks.

### CLAIM FOR EXTRAS.

AT the meeting of the Board of Guardians for the City of London Union on May 12, on the subject of the claims of Mr. Holland, the builder, in connection with the alterations at Homerton, Mr. Young said he had received a letter from Mr. Holland, and he was strongly of opinion that the matter should be settled, and Mr. Holland's account paid.

The Clerk read a letter from Mr. J. W. Blashill, the architect appointed by the Board to investigate and report on the subject, stating that he was proceeding as rapidly as possible, and that when the members of the Board were aware of the circumstances under which the report had been delayed they would think the delay justifiable.

Mr. Cox thought Mr. Blashill ought to give them a date when they might expect his report. He ought to be written to and asked to furnish the Board with this explanation. He had had the matter in hand nearly three months, and he would move that he be written to for the information, a motion which was adopted.

The Clerk read a letter from Mr. Judge, the architect of the alterations, calling attention to the balance of his account still outstanding, 219*l.*, and stating that unless the amount be paid within ten days from date he must very reluctantly place the matter in the hands of his solicitor for its recovery, also notifying that he shall claim interest at the rate of 5 per cent. per annum.

Mr. Tattersall asserted that Mr. Judge had been paid everything under the contract, and he was simply going to move, without a word of comment, this resolution:—"That this Board cannot recognise Mr. Judge's claim for commission until it is decided whether anything is due to the contractor for extras, and until it is ascertained what counter-claim the Guardians have against Mr. Judge."

The Clerk said that Mr. Judge sent in an account for 428*l.* 9*s.* There was a small item, 3*l.* 3*s.*, charged for attendance and preparing plans; then attending committees, 4*l.* 4*s.*; 349*l.* was the charge upon 6,993*l.* Then there were two small items of one guinea each; then various attendances upon the committee, and charges for surveying, &c., amounting to 70*l.*; making a total of 429*l.* 9*s.* Mr. Judge had received on October 10 109*l.* 9*s.*, and on February 28 100*l.*, making 209*l.* 9*s.*, which left 219*l.* due to him.

Mr. Tattersall had always understood that Mr. Judge had been paid all that was due to him on the contract; if that was

not the case the Board would be very willing to pay him. The question that the Board disputed was as to the extras. If there was anything due to Mr. Judge under the original contract, let him be paid.

Mr. W. H. Wagstaff moved that the letter be referred to the Homerton Committee, for them to inquire what was due to Mr. Judge, and that he be paid.

The motion was carried.

The Clerk read a letter from Mr. Holland, in which the following paragraphs appeared:—"Having read the remarks made by the members of your committee, I have taken the liberty of introducing a few questions (copy enclosed), that the committee may reply. It will then give the Board some idea of the extent of their investigations in this case, the work having been completed on July 29, 1884. In a similar case to this, another Board having been compelled to pay the builders' account, also a considerable sum of legal expenses, is, I hope, a sufficient apology for my bringing this case before you."

At the meeting on Tuesday, the 19th inst., the Clerk read the following letter from Mr. Blashill:—"10 Old Jewry Chambers, May 18, 1885. Dear Sir,—Homerton Workhouse. I am in receipt of your letter of the 13th inst., in which you ask me to let you know, for the information of the Guardians, at what date I shall send in my report. In naming a time I think it best to inform the Board that the documents handed to me by the committee relate to a claim by the contractor for additional works to the amount of 5,725*l.* 10*s.* 3*d.*, with an allowance for works omitted of 2,937*l.* 1*s.* 8*d.* The whole of these additions and omissions, amounting as they do to 8,662*l.* 11*s.* 11*d.*, have to be dealt with by me before I can make my report. The committee have handed to me, as the only statement presented to them, a bill in which these additions and omissions are stated under certain general heads, and in lump sums varying from 6*l.* 3*s.* 7*d.* to 1,638*l.* 2*s.* 2*d.*, no information having been given as to the details which make up those lump sums. I am employed to ascertain in the fairest way possible whether the claim made by the contractor is a proper one, and on my appointment becoming known to Mr. Holland he instructed a surveyor to see me and give me all the details of the claim, and all facilities for making my report. This offer has been repeated on subsequent occasions, but I have never received any such information, and I am now proceeding with this part of the investigation by other means. I have no doubt that I shall be able to complete my report within five weeks from this date.—(Signed) J. W. BLASHILL."

This letter, together with one from Mr. Holland, was ordered to lie on the table.

### PROTECTION OF WOODEN BUILDINGS.

THE following is an American recipe for rendering wood factory buildings more fire-resisting. The method consists in filling the spaces between the studding with a grout made of sand, lime, and a large proportion of sawdust. Mixed with sufficient water to flow slowly, it becomes quite hard, is a poor conductor of heat, and will not ignite although it is charred by exposure to an intense fire. This applies to a building already constructed, where it would be a difficult task to remove the sheathing, or lath and plaster already on the inside walls. Where the studding is already exposed on the inner side, the space is frequently filled with brick, masonry, or large tiles made for such purposes. A new material made for such purposes in America is called terra-cotta lumber, and is composed of top clay, which overlies the firebrick clay, mixed with equal or double quantities of sawdust. Every vestige of the sawdust disappears in firing, leaving the tiles very porous. Its use is not limited to filling walls, but it is applied to other purposes of construction where refractory materials are desired, as for short joists between iron floor beams, roofs, coverings to iron columns and beams, sheathings for internally fired boilers, and steam pipes. Small cylinders of this material are arranged with suitable coverings, filled with petroleum and used for torches. Nails and screws can be driven into it, and it can be cut to dimension with edge tools as desired.

### ARCHÆOLOGY.

**Lancashire and Cheshire Antiquarian Society.**—The members of this society on Tuesday evening visited Reddish. The expedition was conducted by the Rev. Addison Crofton, vicar of St. Elizabeth's, and the places of interest visited were the Nico Ditch, the old road near Pink Bank Plantation, and Peel Moat in Heaton Norris. The first of these, Nico Ditch, forms the parish boundary between Gorton and Reddish, and extends in its full length from Ashton Moss to Ouse Moss. It is said to have been formed in a single night by the Saxons to repel a threatened invasion by the Danes. The old road is merely a remnant left standing alone in the midst of a wide expanse of pasture land. It still shows some signs of pavement,

and is bordered by the dead and weird-looking remains of a once leafy avenue of oaks. It is generally almost impassable from the swampy nature of the ground, and the almost abysmal ruts and holes, but on the occasion of the society's visit the comparatively dry weather had made travelling pleasant and easy. The long length of Pink Bank Lane offered nothing of great interest; but Peel Moat, which was reached in due time, was certainly worthy of a visit, and a short address from the conductor concerning the supposed origin of the name and use of the place occupied a few minutes before the members proceeded to walk round the square enclosure and make their observations on this curious remnant of the past.

#### The Ashpitol Prize.

SIR,—A letter from "A. B. C." in your last issue, calls attention to the fact that the Ashpitol Prize has been withheld for two years: further, that the prize was instituted about 1873. Now the first voluntary architectural examination took place in 1862. Would it not be a gracious act on the part of the Council of the Institute to make the reward retrospective, and to give the two prizes not awarded to those candidates who passed the most successfully in past years? A precedent for this would be found in the case of the Pugin students, who this year had medals awarded to them going back to the first recipient of the prize. X. Y. Z.

### CHURCH BUILDING AND RESTORATION.

**Pembridge.**—A Congregational chapel built in place of the old and dilapidated structure has been opened. It was built by Mr. C. Edwards, contractor, Leominster, from the plans of Mr. Percival Vernon, of Hereford.

**Carlton.**—The church of St. Paul erected at Carlton has been opened. Only a portion of the church has been built, being chancel and part of nave. The style is Lombardic, and the materials used are red brick and London grey stocks, with terra-cotta enrichments from the Hathern Terra-cotta Company, Loughborough. Adjoining the church a vicarage has been built in red brick, the contractor being Mr. Brown, of Stanley Common, near Derby. The builders of the church were Messrs. Bradley & Barber, of Nottingham. The church and rectory have been built from designs by Mr. W. A. Coombs, architect, 31 Charing Cross, London.

**Walton.**—A church at Walton, near Warrington, built at the cost of Sir G. Greenall, has been opened. The style of the building is Gothic. The sole contractor was Mr. R. Fairhurst, of Higher Whitley, Northwich.

**Keystone.**—The porch of the church at Keystone has been restored. The work has been carried out by Messrs. W. Streather & Sons, of Raunds.

### SCHOOL BUILDINGS.

**West Vale.**—A Sunday-school erected in connection with St. John's Church has been opened. The building is of local stone, in Gothic style, planned by Mr. W. H. D. Horsfall, of Halifax. The contractors were—mason, Mr. Thomas Pickles, Midgley; joiner, &c., Messrs. C. & W. Whiteley, Rishworth; slaters and plasterers, Messrs. Wadsworth & Sons, Greetland; plumbers and glaziers, also heating apparatus, by Messrs. S. & W. H. Jagger, Elland; painters, Messrs. E. Whitehead & Co., Sowerby Bridge.

**Huddersfield.**—Extensions have been carried out at the Lockwood Board School. The new school will accommodate 460 children, and provision is being made for a cookery-room for fifty girls. The style of architecture adopted is Early Gothic, and the materials for the exterior are Elland edgestone, pitch-faced with dressings of Crosland Hill stone. The total amount of the contracts entered into is 5,411*l.* 10*s.*, which includes various works in connection with the school buildings, providing two large covered play-sheds for the infants, altering and enlarging the offices, and concreting the play-grounds. The designs have been prepared by Messrs. Henman & Harrison, architects, London.

**Sunderland.**—The foundation-stone of Sunday schools, to be built in connection with St. Mark's, Millfield, has been laid. The schools are designed in Gothic style by Mr. John Hudson, of High Street, Sunderland, and the contract has been let to Mr. Robert Hudson, jun., for 1,000*l.* The schools are to

accommodate over 500 scholars, and will be built of brick, relieved by stone corbels, and will, when completed, be 90 feet long by 50 feet wide, with an entrance porch 15 feet by 12, whilst the full height of the building will be 36 feet. The exterior will show four principal gables, with three-light lancet windows within a Gothic arch, the remaining portions showing smaller lancet windows. The interior of the building will consist of two class-rooms on each side, each 12 feet by 9 feet, arranged to be divided off by revolving shutters, whilst a room 26 feet by 22 feet can be also shut off in the same way when small meetings are held.

### GENERAL.

**The Royal Scottish Academy** closed on Saturday last after being open during three months. The attendance of visitors and the amount derived from sales of pictures has been on a par with that of previous years.

**The Annual Conversazione of the Society of Arts** will be held at the Inventions Exhibition on Friday, July 3.

**The Testimonial** subscribed for last year will be presented to the Lord Mayor on Thursday, the 28th inst. The presentation includes a portrait by Mr. F. Holl, R.A.

**Mr. Watts, R.A.**, is at work on a half-length portrait of Miss Mary Anderson.

**The Private View** of the Exhibition of the Society of Painter-Etchers takes place to-day (Saturday).

**The Assyrian Room** at the British Museum has been enriched by a collection of engraved stones from Assyria and Babylonia. Besides inscriptions are various representations of animals, &c., and such groups as that of *Dagon and a Lotus*, a man carrying a basket, a man seizing an antelope by the hind leg, and a goat before a small tree over which the sun shines.

**The Annual Excursion** of the Edinburgh Architectural Association will take place on Saturday, the 30th inst., under the leadership of Mr. Hippolyte J. Blane. The visit will be made to Aberdour and Inchcolm.

**Mr. Thomas Blashill** read a paper before the members of the Archæological Association on Wednesday evening, on "The Cistercian Abbey of Dore."

**A Cottage Hospital** is to be erected at Bideford, from the designs of Mr. Wilson, architect.

**A Corn Exchange**, with Public Baths and Butter Market, are to be erected at Beverley, and competitive designs will be invited for the buildings by the Town Council.

**Sir J. Coode, C.E.**, has selected a site at Trincomalee for a dry dock, which is to be constructed forthwith for the Government.

**The Chancel** of the cathedral which is being erected at Honolulu was ready for roofing, according to advices dating from the middle of April.

**Mr. John Shaw**, of the College, Derby, and Mr. J. R. Naylor, Derby, have been appointed jointly with Mr. F. J. Robinson, Derby, surveyors for the diocese under the Ecclesiastical Dilapidations Act.

**By the Death of Mrs. Chambers**, the widow of the late Dr. W. Chambers, of Edinburgh, on Saturday last, a sum of 5,000*l.*, bequeathed by her late husband to the Watt Institution and School of Arts, under life-rented conditions, will, it is understood, now become payable.

**The Yarmouth Town Council** have decided on obtaining the services of an engineer to advise them as to the stability of the Town Hall.

**Mr. Stevenson's** design for the erection of the chemical laboratory at Cambridge has been approved of by the University authorities.

**The Committee** having in hand the work of restoring St. Michael's Church, Coventry, have provisionally accepted a tender for the execution of nearly the whole of the restoration, at a cost of 31,163*l.*

**A Memorial** has been presented to the Secretary of State for India begging him to direct that the work of deepening the inner harbour at Aden, so as to enable vessels of deep draught to enter, remain afloat, and leave at all states of the tide, shall be begun as soon as possible.

**The New Infirmary** of the Croydon Union was opened on Saturday. The designs are for six pavilions, with 643 beds; but up to the present only four pavilions, with 435 beds, have been erected, the cost of building being 101,000*l.*

**The Ladies' Sanitary Association** of Wolverhampton held their annual meeting on Friday last week in the Town Hall, Wolverhampton.

**An Inland Navigation Congress** is to be opened in Brussels on the 24th inst. More than five hundred persons have already announced their intention to attend. The programme includes consideration of canals in general, maritime canals, non-maritime canals, and technical subjects. Visits to the Belgian maritime canals are projected.

A Business Supplement

# The Contract Reporter.

to The Architect.

LONDON, MAY 23, 1885.

## TENDERS, ETC.

*As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 5 p.m. on Thursdays.*

*Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—"Contract Reporter to THE ARCHITECT."*

## NATIONAL AGRICULTURAL HALL.

TENDERS have just been sent in for the National Agricultural Hall, South Kensington. The quantities were taken out by Messrs. Franklin & Andrews, and the work is to be executed under the superintendence of the architect to the Company, Mr. Henry E. Coe. The American and also the Colonial Exhibitions are to be held in the new building in the spring of next year. The full list of tenders will be found on page 5.

## AMERICAN EXHIBITION, LONDON, 1886.

A SITE for the proposed exhibition has been chosen at Earl's Court. The selected site is but a short distance from South Kensington, and situated in the best part of London. The property to be occupied by the exhibition covers about twenty acres, and has railway advantages in advance of any exhibition ever held in London. The station for the District Railway will be in the exhibition grounds, and another one will be at West Brompton, a few steps from the entrance to the main building. Every railway in Great Britain will have facilities for immediate and direct connection with the exhibition building. As the two great exhibitions—the Colonial and the American—will thus be in almost direct contiguity, millions of visitors will be saved the trouble and expense of cab fare from one part of London to another. The delay in the selection of a site is additional evidence of the prudence of the managers, who have had to withstand much pressure in favour of the Crystal Palace, Alexandra Palace, and other locations. There can be no question but that the present site selected has advantages over any other to be had in London.

## BIRMINGHAM BUILDERS' ASSOCIATION.

A MEETING of the Birmingham Builders' Association was held at the Grand Hotel, Birmingham, last week. Mr. John Bowen presided, and there were also present Messrs. A. S. Smith,

W. Sapcote, C. H. Barnsley, C. W. Barker, T. Surman, J. Jeffery, W. J. Whittall, Councillor Loughton, E. J. Bigwood, secretary, &c., &c. The rules of the Association were revised, adopted, and ordered to be printed. The President, in moving the adoption of the schedule of day-work prices, as revised by the committee of the Association, said that it had been the endeavour of the committee to make the prices fair and just between employer and employed, and expressed a hope that this fact would be recognised by all parties, and that the revised list might be taken as the standard prices of the trade throughout the town. The schedule of prices was adopted, and ordered to be circulated amongst the architects and surveyors of the town.

## CONTRACTS OPEN.

ALNWICK.—May 23.—For Building Bridge over Tyelaw Burn. Mr. C. Percy, Clerk to the Highway Board, Alnwick.

BANDON.—June 8.—For Construction of Water Works. Mr. James Price, C.E., 44 Harcourt Street, Dublin.

BARNET.—May 23.—For Construction of Road (1,650 feet) with Kerb. Messrs. W. & F. Houghton, Surveyors, 61 Old Broad Street, E.C.

BATH.—May 25.—For Building River Wall near Monk's Mill. Mr. C. E. Davis, F.S.A., City Architect, 55 Great Pulteney Street, Bath.

BATLEY.—May 29.—For Building Seven Terrace Houses, Park Road. Mr. Walter Hanstock, A.R.I.B.A., Branch Road, Batley.

BELFAST.—May 26.—For Building Waiting-shed and Offices at Brookmount Station. Mr. J. P. Culverwell, Secretary, Great Northern Railway, Belfast.

BINGLEY.—May 28.—For Building Six Cottages. Mr. John Haggas, Architect, North Street, Keighley.

BRIGHOUSE.—June 1.—For Building Coal and Cannel Stores, Station Meter House, Retaining Wall, Purifier House, and Lime Store, and for Columns, Girders, Four Purifiers, with Covers, &c., Cover-lifting Apparatus, and Wrought-iron Roof. Mr. James Parkinson, Engineer, Brighouse.

BUCKNALL.—May 29.—For Building Infectious Diseases Hospital and Fence Wall, and for Drainage and Irrigation Works. Mr. G. W. Bradford, Architect, Miles Bank Chambers, Hanley.

BURNLEY.—May 23.—For Building Vestry and Class-rooms, Organ Case, &c., at Salem Chapel. Mr. G. B. Rawcliffe, Architect, 8 Ormerod Street, Burnley.

BURNLEY.—For Building Two Residences. Mr. C. Parsons, Architect, 9 Grimshawe Street, Burnley.

BUXTON.—May 29.—For Building Destructor and Chimney Shaft, Making Road, &c. Mr. J. Hague, C.E., Town Surveyor, Buxton.

CHRISTCHURCH.—May 28.—For Building Schools for the Guardians of the Poor. Mr. Edgar H. Burton, Architect, Bournemouth.

CIRENCESTER.—May 28.—For Erection of Female Infirmary, Laundry, &c., and Alterations to the Existing Buildings at Union Workhouse. Mr. W. L. Cooke, Solicitor, Cirencester.

CLOWNE.—June 3.—For Building Semi-detached House and Additions to Business and other Premises. Mr. Herbert Hodgson, Architect, 68 High Street, Queensbury.

COLNE AND MARSDEN.—May 25.—For Forming Brick Barrel Sewer; Building Piers, to carry a wrought-iron Trough; the Raising of an Occupation Road; Laying Iron and Earthenware Pipes, 960 yards. Mr. Henry Bancroft, C.E., 83 Mosley Street, Manchester.

CRICCIETH.—June 1.—For Building Nave and other Portions of Church. Messrs. Douglas & Fordham, Architects, 6 Abbey Square, Chester.

DARTFORD.—May 23.—For Building Machinery House for Electric Lighting of Hospital Ships at Long Reach. Messrs. H. Jarvis & Son, Architects, 29 Trinity Square, S.E.

DEWSBURY.—June 3.—For Construction of Reservoir. Messrs. Bateman & Hill, C.E., Albert Chambers, Albert Square, Manchester.

DARLINGTON.—May 27.—For Construction of Pump-house and Iron Tank at Gasworks. Mr. Hugh Dunn, Town Clerk, Darlington.

DENBY DALE.—May 30.—For Enlarging and Re-furnishing Primitive Methodist Chapel. Mr. T. T. Howdell, Architect, 40 Park Lane, Leeds.

DEWSBURY.—May 25.—For Building Branch Stores. Mr. Henry Holtom, Architect, Bond Street, Dewsbury.

DEWSBURY.—May 27.—For Building Two Shops and Alterations of Premises. Mr. Henry Holtom, Architect, Bond Street, Dewsbury.

DONCASTER.—May 29.—For Alterations and Additions to Congregational Church. Mr. C. J. Innocent, Architect, 17 George Street, Sheffield.

DONEGAL.—June 3.—For Erection of Dwellings, Gasworks, Fog-signal House, &c., at Tory Island Lighthouse. Messrs. Gribbon & Butler, Quantity Surveyors, 22 Lombard Street, Belfast.

EDINBURGH.—June 1.—For Building Board School. Mr. Robert Wilson, Architect, 2 Queen Street, Edinburgh.

EDINBURGH.—June 6.—For Construction of Wrought-iron Girder Gangway. Messrs. Leslie & Reid, C.E., 72A George Street, Edinburgh.

ELGIN.—May 28.—For Building Dwelling-house, Public Laundry, and Baths. Mr. H. M. S. Mackay, C.E., Elgin.

ELLAND.—June 4.—For Building Fireproof Mill, Engine and Boiler-houses, Dule Room, Chimney, &c. Messrs. Horsfall & Williams, Architects, Post Office Buildings, Halifax.

GAWTHORPE.—For Building Two Houses. Mr. F. W. Ridgway, Architect, Dewsbury.

HALIFAX.—June 6.—For Erection of Farm-house and other Buildings, Exley Bank Top. Messrs. Jackson & Fox, Architects, 22 George Street, Halifax.

HARROGATE.—For Building Club. Messrs. H. E. & A. Bown, Architects, James Street, Harrogate.

**HECKMONDWIKE.**—May 29.—For Altering and Repairing Chapel. Mr. A. A. Stott, Architect, Heckmondwike.

**HELME.**—May 28.—For Building Residence, Stable, Coach-house, &c. Messrs. John Kirk & Son, Architects, Huddersfield.

**HEREFORD.**—May 25.—For Stables, Carriage-shed, Loose Boxes, Harness-room, &c., at Cattle Market Hotel. Mr. John Parker, City Surveyor, Hereford.

**HEREFORD.**—May 26.—For Additions, Clehonger Vicarage, near Hereford. Messrs. Nicholson & Son, Architects, Hereford.

**HIPPERHOLME.**—May 28.—For Building Three Dwellings at White Hall. Mr. Edwin Taylor, Architect, Hipperholme.

**HOVE.**—June 6.—For Erection of Ornamental Iron Fence (Designs and Tenders). Mr. C. A. Woolley, Town Clerk, Hove, Brighton.

**HUNSLET.**—May 27.—For Building Shop and Twelve Cottages. Messrs. Clayton, Son & Co., Hunslet.

**HYDE.**—June 3.—For Erection of a Stage-floor Retort-house, at the Gasworks. Mr. Thomas Newbigging, C.E., No. 5 Norfolk Street, Manchester.

**KIRKCALDY.**—June 5.—For Construction of Wet Dock and Railways in connection in the County of Fife. Mr. John Macrae, C.E., 107 Princes Street, Edinburgh.

**KILDRUMMY.**—May 25.—For Building Dwelling-house at Ley of Towie. Messrs. Walker & Beattie, Surveyors, 3 Golden Square, Aberdeen.

**KNIGHTON.**—June 3.—For Erection of Workhouse Buildings. Mr. E. H. Deacon, Clerk to the Guardians, Knighton, Radnorshire.

**KNOWLE, FAREHAM.**—June 9.—For Building Group of Cottages at the County Asylum. Mr. James Robinson, County Architect, County Hall, Winchester.

**LEAMINGTON.**—May 23.—For Building St. Nicholas Parish Rooms and Sunday Schools. Mr. J. Cundall, Architect, 90 The Parade, Leamington.

**LISMORE.**—June 3.—For Building Sixty-one Cottages. The Clerk to the Guardians, Lismore.

**LITTLEBOROUGH.**—For Extension of Chapel. Messrs. Potts, Pickup & Dixon, Architects, Oldham.

**LIVEREDGE.**—June 1.—For Engines, Boiler, Machinery, and Apparatus for Sewage Works. Mr. Charles Gott, C.E., 8 Charles Street, Bradford.

**LONG EATON.**—May 23.—For Building Two Cottages, with Out-offices, Boundary Walls, &c., on Sewage Farm. Mr. John Sheldon, Architect, Market Place, Long Eaton.

**MARSH.**—June 2.—For Building Eight Cottages. Mr. J. E. Moseley, Architect, 4 Wellington Buildings, Huddersfield.

**MARYPORT.**—May 23.—For Converting Out-buildings, at Flimby Lodge, into Vagrant Wards. Messrs. Eaglesfield & Son, Architects, Maryport.

**MOLD.**—May 25.—For Building Houses and Shops. Mr. E. Muspratt, Surveyor, 7 John Street, Chester.

**MYTHOLMROYD.**—May 22.—For Building Wesleyan Minister's House. Mr. W. H. Cockroft, Architect, Hanging Royd Road, Hebden Bridge.

**MYTHOLMROYD.**—May 31.—For Building Working Men's Club at Cragg. Mr. W. H. Cockroft, Architect, Hanging Royd Road, Hebden Bridge.

**NEATH.**—May 25.—For Constructing Wooden Bridge over River at Aberdulais. Mr. James Kempthorne, Dyffryn Chambers, Neath.

**NEWBIGGIN.**—May 23.—For Erection of Slaughter-house and other Buildings. Messrs. Boulds & Hardy, Architects, Grainger Street, Newcastle-on-Tyne.

**NEWBRIDGE.**—May 27.—For Building Wesleyan Chapel. Mr. G. Rosser, Architect, Arcade Chambers, Newport, Mon.

**NEWPORT.**—May 20.—For Construction of Two Improved Beale's Patent Gas Exhausters. The Engineer, Gas Offices, Mill Street, Newport, Mon.

**NORMANTON.**—May 28.—For Building Two Shops and Dwelling-houses, with Offices, Warehouse, Landing-stage, Coach-house, Stable, &c. Mr. Thomas Reid, Architect, Normanton.

**NOTTINGHAM.**—May 28.—For Constructing and Laying-out Cattle Market, Eastcroft, including Bridge, Offices, Lodges, &c. Mr. A. Brown, Borough Engineer, Municipal Offices, Nottingham.

**PONTARDULAIS.**—June 1.—For Restoration of St. Teilo's Church. The Vicar, Pontardulais.

**PONTYPRIDD.**—June 2.—For Additions and Alterations to Union Workhouse. Messrs. James, Seward & Thomas, Architects, St. John's Chambers, Cardiff.

**PONTYPRIDD.**—June 4.—For Building Chapel. Mr. Kingdom, New Foundry Road, Hopkinstown, Pontypridd.

**PUDSEY.**—May 25.—For Erection of Farm Buildings. Mr. J. Kendall, Architect, Idle.

**REDRUTH.**—May 29.—For Building Board Schools at Trewirgie. Messrs. G. B. Nichols & Sons, 59 Colmore Row, Birmingham.

**RHYL.**—May 25.—For Building Church. Mr. D. Walker, Architect, 11 Dale Street, Liverpool.

**SCAWTON, HELMSLEY.**—May 25.—For Building Parsonage House. Mr. W. H. Blessley, Architect, Exchange Place, Middlesbrough.

**SHEFFIELD.**—May 25.—For Building Sunday School, with Class-rooms, &c. Mr. C. J. Innocent, Architect, 17 George Street, Sheffield.

**STOKE-ON-TRENT.**—May 30.—For Building Manager's House for Tramways Co. Mr. G. W. Bradford, Architect, Miles Bank Chambers, Hanley.

**SOUTH SHIELDS.**—May 27.—For Erection of Buildings on Corporation Quay. Mr. Matthew Hall, Borough Engineer.

**SWINDON.**—June 6.—For Building Baptist Tabernacle and Schools. Mr. W. H. Read, Architect, Corn Exchange, Swindon.

**SYDNEY.**—June 1.—For Steel Bridge to Carry Double Line of Railway over the River Hawkes-

# R. ADAMS,

17 BLACKMAN STREET & 7 GREAT DOVER STREET, LONDON, S.E.,  
INVENTOR and PATENTEE of the  
SAFETY WINDOW WITH REVERSIBLE SASHES

FOR

## INEXPENSIVE & PERPETUAL CLEANLINESS

Which has gained at the INTERNATIONAL HEALTH and  
SANITARY EXHIBITIONS

2 Gold, 4 Silver, and 4 Bronze Medals,  
and 16 Diplomas of Merit.

The fearful sacrifice yearly of Life and Limb of persons in cleaning windows through sitting or standing outside whilst so engaged is most appalling. This can now be entirely prevented. The Patentee, having given this subject the most exhaustive study, is now prepared to supply his patent fittings suitable both for old and new windows at prices to meet the means of all. These improvements are protected by several patents, by each of which the outside of each sash can be reversed for cleaning, and under this new system that duty is rendered a pleasure, whilst the danger, risk, and tremendous responsibility of moral and statute law is removed.

These patent fittings can be procured from 5s. for each sash, and all builders have the right conferred upon them to fit the same in the purchase thereof, and that all shall have the benefit of this national boon, special Agencies are being established throughout the United Kingdom. None but practical and responsible firms are appointed. Such firms are invited to apply for unrepresented districts at once, as it is desirable to complete the list as soon as possible.

The present representatives are:—

# RENDLE'S "ACME" GLAZING

Patentees:—**W. E. RENDLE & CO.,**  
3 WESTMINSTER CHAMBERS, VICTORIA STREET, LONDON.

TO  
ARCHITECTS, BUILDERS,  
AND  
CONTRACTORS.

## STEEL CUT NAILS!!

The modern and important discovery in the process of making Steel has so reduced the price, that Steel Cut Nails of the well-known "Mitre Brand" can now be supplied at only 1s. 6d. per cwt. more than the price of the ordinary Common Iron Cut Nails.

The Steel Cut Nails are far superior in quality and more uniform in size than any wrought or hand-made Nails yet produced, and being lighter in weight than ordinary Iron Cut Nails and free from rust, they are found cheaper in actual use than common Iron Cut Nails at 1s. 6d. per cwt. less.

These Steel Cut Nails are specially suited for Builders, Joiners, Coopers, Packing-Case Makers, &c., and a single trial is sufficient to convince any one of their superior quality and cheapness.

**PATENT WROUGHT STEEL NAILS.**  
**OVAL WIRE NAILS.**

Ask your Factor or Ironmonger for  
"MITRE NAILS."  
WHOLESALE AND EXPORT ONLY.

FIRST-CLASS CERTIFICATE AND SILVER MEDAL  
AT CALCUTTA EXHIBITION.

## SAND. SAND.

BEST AND CHEAPEST FOR BUILDERS' PURPOSES.  
Guaranteed Sharp and Clean.

For sample, price, railway and canal rates, apply to

**AS SUPPLIED TO 600 PUBLIC HEALTH BODIES.**

The Sanitas Co., Limited, Bethnal Green, E.

**GRUNDY'S PATENT WARM-AIR VENTILATING FIRE GRATE.**

The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.

**TESTIMONIALS.**

"9 Victoria Chambers, Westminster, S.W.

"June 10, 1884.

"SIR,—I have much pleasure in testifying to the efficiency of your patent Warm-Air Fire Grate. It has been very successful, and given every satisfaction where I have used it.

Yours, &c.

"To Mr. Grundy. JAMES WEIR, F.R.I.B.A."

"Baptist Chapel, Clapham Common, London. Richard Webb, Pastor, 10 Grafton Square.

"February 15, 1884.

"DEAR MR. GRUNDY,—I have pleasure in testifying to the excellency and efficiency of your patent Fire-Grate. It is the most charming invention for heating a large room I have ever known. I shall have pleasure in showing it to anyone who wish to have their schools or rooms pleasantly and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool, July 1884.

"DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public.

"Mr. John Grundy."

From Hon. and Rev. G. G. Talbot, M.A., Withington Cheltenham.

"DEAR SIR,—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen.

"Mr. John Grundy."

From F. J. Yates, Esq., Architect, Birmingham.

"The best of the kind I have seen. I shall have pleasure in securing their adoption whenever opportunity offers."

CALVANIZING-WORKS  
LIVERPOOL.

**BLUNDELL'S PETRIFYING LIQUID**

Is a preparation for interior use, for the cure of **DAMP WALLS**. It is made in two colours, White and Red. It is applied with a brush as easily as ordinary paint, and dries hard in a few hours with a glazed surface. The many uses of such an article are obvious. As an economical substitute for White and Red Glazed Bricks, for interior walls, it is most efficient. Applied over brick, cement, iron, or wood, for the walls of passages, kitchens, schoolrooms, hospitals, and charitable institutions, where **CLEANLINESS** is indispensable, it will be found invaluable, as the smooth enamelled surface offers but little hold for dirt, &c., and can be washed when necessary. Used over walls before papering, it prevents discolouration, and offers a surface to which the paper will adhere firmly. Economical in cost, simple in application, and efficient in use. The proprietors recommend it with full confidence. To be obtained of the leading Paint, Colour, and Varnish Dealers.

**BLUNDELL, SPENCE & COMPANY, LIMITED,**

Colour, Paint, and Varnish Makers, Oil Boilers and Refiners,  
HULL, and ANCHOR WHARF, 9 UPPER THAMES STREET, LONDON, E.C.

For Heating Holy Trinity Church, Hereford. BACON & Co., London (accepted).

## NOTICE OF REMOVAL.

# BELLMAN'S PATENT GULLY.

This Gully possesses the following advantages:—

Receives and disconnects one Rain-water Pipe and Three Waste Pipes.

Avoids all Splashing.

Forms Drain for Area or Surface.

Ventilates the Pipes and Trap.

Is easy of Access for Clearance.

The ordinary P or S trap to be used in connection with Gully being in a separate piece, can be placed at any angle to meet the drain exactly, thus insuring a perfect joint, the Gully being fixed at right angles. This is a great advantage over other arrangements made with the trap in one piece.

The Holes for Rain-water Pipes are made both Circular and Square and of various sizes.

DESCRIPTIVE CIRCULAR ON APPLICATION.

THIS GULLY IS HIGHLY RECOMMENDED by Authorities on Sanitary Matters.

PRICE AT DEPOT:—EDWARD ST., DORSET SQUARE, N.W., 8s. 6d. each.

Also SINGLE GULLIES, for Sink Wastes only, price 3/9 each.

**BELLMAN & IVEY,**

(OFFICE ONLY) 37 PICCADILLY, LONDON, W.

**TRADE NOTES.**

MR. MABEY, whose lamp columns at Northumberland Avenue are so much admired, has been requested by the City Lands Committee to send in a design for the new statue of *Queen Anne* to be erected in the place of the existing statue in St. Paul's Churchyard.

A MEDAL has recently been presented by the Government of India to all those who took any leading part in contributing to the success of the Calcutta International Exhibition. The medal, which is 3 inches diameter, bears on the obverse a portrait of the Queen, with the words "Victoria Empress." Her Majesty is represented as wearing her royal crown, from which a veil falls over the back of the head and neck. She also wears the star, badge, and riband of the Order of the Star of India. The reverse shows a group of allegorical female figures representing India seated under the protection of Britannia, surrounded by articles of Indian produce and manufacture, while before her stand or kneel Europe, America, Africa, and Australia, bringing the various products and inventions of their countries for submission to the inspection of India. The medals were designed and executed by Messrs. Wyon, of Regent Street, London.

THE ancient church of Nunnington, which was reopened in August last, after restoration, has just received the addition of a handsome marble reredos, the gift of Mr. John Rutson, of Nunnington Hall and Newby Wiske. The

**JOHN G. ROLLINS & CO., LD.,**  
AMERICAN MERCHANTS AND FACTORS,  
OLD SWAN WHARF, LONDON BRIDGE, LONDON, E.C.

eredos, which covers the whole of the east wall below the window, is of red Devonshire marble, divided into long panels by strips of black Belgian marble. In the centre tablet is the sacred monogram, with the Alpha and Omega in the tablets on the north and south sides. The whole is surmounted by a cornice of Caen stone. The design was supplied by Mr. Ewan Christian, under whose direction the restoration of the church was carried out; and Messrs. Williams & Nash, of Holborn, executed the reredos.

THE Executive Committee of the International Inventions Exhibition having selected Phillips's patent lockjaw roofing tiles for the roof of the pavilion, situated outside the north court, Mr. Charles D. Phillips, of Newport, Mon., completed the roof with his patent tiles, although at short notice, in excellent time, and has erected a very attractive and ornamental building, which is occupied by Mr. Etzenburg, and is situated in a very prominent position. The object of this roofing tile is to form a perfectly weather-resisting roof, and be impervious to wind, rain, or snow, all points necessary for an efficient roof, and at the same time combine economy and ornamentation. By forming a groove and tenon joint on all four sides, the objection of the heavy overlap is avoided, and consequently the roof is lighter, and requires less timber. There are no less than eight works making them at present, and some large contracts for railway companies, public buildings, and roofing generally, have already been executed, and are on hand. These tiles will be shown at the Bath and West of England Show at Brighton.

A STAINED-GLASS window has been placed in St. Alban's Church, Cheetwood, in memory of the late Mr. Bold, chorister and sacristan of the church for several years. The window, which has been executed by Messrs. Clayton & Bell, of London, contains medallions illustrating the four canticles—"Te Deum," "Magnificat," "Benedictus," and "Nunc Dimittis."

ANOTHER three-light window, by Mayer & Co., of Munich, has just been erected in the parish church of Prestbury, Macclesfield. It

represents "The Good Samaritan," and is the third already executed by the same firm for this church.

WE are requested by the Secretary to the Royal National Hospital to state that on Ascension Day a painted three-light window, representing "Faith, Hope, and Charity," was unveiled in St. Luke's Chapel of the Royal National Hospital for Consumption, Ventnor, being the gift of Mr. Stafford Henry Northcote and family, in memory of the late Mrs. Northcote, who was a warm friend and benefactress of the hospital. The work was executed by Messrs. Heaton, Butler & Bayne, of Garrick Street, W.C.

A LARGE new east window, designed and executed by Messrs. Heaton, Butler & Bayne, of 14 Garrick Street, W.C., has just been placed in Willington Church, Bedford, for the Rev. Augustus Orlebar, which was opened by a dedication service, held by the Bishop of Ely after the confirmation on the 8th inst. One of the chief subscribers to this work was his grace the Duke of Bedford.

#### BEXHILL-ON-SEA DRAINAGE.

OUT of the nine schemes for drainage sent in some time back in competition, at the meeting of the above local board last week the plans of Messrs. Nichols & Sons (Birmingham) were selected on the grounds of economy mainly, and after considerable discussion. But on the report of Mr. Andrews, Borough Surveyor of Hastings, acting in conjunction with the board's surveyor, that the plans of Mr. H. C. Roper, C.E. (Dudley), contained many good and essential points, the board decided to offer 14*l.* for the retention of his plans, and the others to be returned with thanks for the trouble taken. The other competitors were Messrs. Davison & Sons (Windsor), J. B. Wall (Walbrook, London), Orchard & Van Putten (Lewisham), Lailey & Reade (Westminster), Francis & Robinson (Furnival's Inn), Cobbold (St. Albans), and Fowler (Manchester). No premium was offered, but several most elaborate and well considered plans were sent in

#### INVENTORS' INSTITUTE.

ON Monday evening—Mr. C. E. Spagnoletti in the chair—a paper on "Electric Tramscars" was read by Mr. A. Reckenzaun. After a comparison of horse, steam, and compressed air traction with electrical traction, the difference of the electric tramscars from electric tramways and railways was pointed out to be that, whereas in electric tramways the energy is conveyed from the generating station to the rails or other conductor communicating with the motor which turns the car-wheels, the electric car carries its own energy within itself, and is quite independent of external influence, and the car can travel over any road or rail for whatever system, ordinary or specially designed. For tramcar propulsion it is absolutely necessary that the motor should have high efficiency, and at the same time be of small dimensions and light weight. An improved machine of the author's had these qualifications. For the car there are two motors, each capable of working up to nearly nine horse-power, and weighing 420 lbs. Each motor is carried separately upon a small bogie, in such a way that each bogie forms a small locomotive engine, upon which the car rests. One axle of each bogie is a driving axle; thus are actuated four small driving wheels. The speed of the motors is high, about 1,000 revolutions per minute when the car is running at seven miles an hour. Thus it is necessary to introduce reducing gear between the motor shaft and the driving axle. The gearing employed is a worm on each motor shaft, and worm-wheels on the driving axles, giving a ratio of about one to twelve. This worm-gearing is cased in and the wheels work in oil, the lubrication being perfect. The variation of speed and power is obtained by means of a compound switch, which arranges the motor circuits so that the machines shall work in series, in parallel or singly; thus the resistance of the circuit being varied, the power and speed vary accordingly; when a greater range of speed is desirable, the motor-circuits are still further divided by

arranging the field-magnet wires apart from the armatures. This obviates cumbersome gearing, which would add to the weight and the expense, increasing first cost and the maintenance as well. Brake-power, both mechanical and electrical, is efficiently applied. The most economical steam tramway locomotives burn from nine to eleven pounds of coal per mile. The coal for charging the electric tram-car batteries amounts to four pounds per indicated horse-power. Reckoning the coal at eighteen shillings per ton, the fuel per car-mile would be less than one penny.

### A LARGE ROOM.

NEW Brighton is within half an hour's run down the Mersey from Liverpool. Here pass all the great Atlantic steamers to and from America. The yellow sands stretch out for miles along the flat beach. The beacon, the battery, and the iron pier stretch out into the waters here and there and act as guide, defender, and friend to the stream of commerce and pleasure, so that as a rule visitors to Liverpool and Birkenhead have a run by steam-ferry down one of England's noblest rivers to look out upon the broad Atlantic from this little stronghold. Facing the ocean, commanding a splendid view, has been built the "Palace" and Winter Gardens, with salt water baths, covering an area of about three acres of land.

The principal room in the palace is used for entertainments, concerts, and dancing. It is only about this room, its size and construction, that we are now about to speak. The floor area of this room, with embayments, is nearly half an acre, being 198 feet long by 104 feet wide in the centre, and 25 feet high throughout. The walls are built in brick, with brick in cement piers, and the whole area is covered with a flat compound iron and concrete roof or floor, which averages 7 inches thick, having but 2 inches fall each way from the centre over the entire area, with a water outlet at the four corners. This roof and floor is carried upon cast-iron

columns in bays 30 feet 6 inches by 22 feet 6 inches, upon brick in cement piers about 16 feet below the floor level, upon a foundation of concrete below ebb tide. Over the 30 feet 6 inches span between column and column in the width of building, rolled compound rivetted girders, 2 feet deep, stretch from side to side, supporting 12-inch girders, which run the length of the room, and over all transversely are rolled joists, which are imbedded in concrete, finished with Seyssel's asphalt rock. This portion of the contract has been executed by Messrs. Homan & Rodgers, of Manchester and London, and the internal plastering of walls and ceilings by Messrs. Tanner & Son, of Liverpool.

A grand organ fills one end of the room, and the floor is laid with pitch-pine for dancing; the flat roof over—used for the same purpose and skating—is constructed to carry a moving weight of 2½ cwt. to the foot, and was tested before use with a slip gauge below, and some hundreds of weighted bags of sand on one bay, and a body of workmen. The deflection was 3-16th of an inch on the 22 feet 6 inch girders, which went back to the normal position after the weight was removed, and the whole has been thoroughly tested by crowds from time to time, without producing the slightest crack in the ceilings below.

From this room to the right are small concert halls, aviaries, grotto and other entertaining-rooms, and on the left is a magnificent promenade conservatory, 135 feet long by 59 feet 6 inches wide, filled with the most beautiful exotics, and surrounded with vineries, azalea and camellia houses, the whole being warmed with some 1,000 feet of hot-water pipes, forming a splendid adjunct to the great hall. These buildings have been executed under contract by Messrs. McKenzie & Moncur, of Edinburgh, and the cement floors and tile pavement by Mr. R. Lowe, of Farnworth. The dancing area is about one acre on floor and roof, and is brilliantly lighted at night by gas and electricity.

The whole has been designed and carried out under the personal superintendence of Mr. T. C. Ebby, architect, of Hamilton Street,

Birkenhead. Upwards of 60,000l. has been spent on the undertaking, and has proved a satisfactory and successful investment to the enterprising proprietor, Mr. Lawrence Connolly, of Liverpool.

### LIABILITY FOR PAYMENT.

A BUILDER of Radford, Mr. J. W. Priestley, has just sued, in the Nottingham County Court, the landlord of the Hand and Heart Inn for payment for work done at his house. Mr. Marriott appeared for the plaintiff, and Mr. W. Fraser represented the defendant. The case for the plaintiff, as stated by himself, was that in October 1883 the defendant instructed him to effect certain alterations to his premises—to alter the doors of the vaults, to put in a ventilator, and to carry out other work. He charged the defendant a reasonable sum, and furnished him with an account at Christmas 1883, and the defendant promised him payment. Some time subsequently, on asking the defendant to pay the account, the defendant asked him to separate the account, charging certain items in the account to the defendant and others to the Springwell Brewery Company, who are the owners of the house. The plaintiff complied with this request, but the Brewery Company denied their liability. He told the defendant of this, whereupon he said, "It is all bosh; I will get the money for you." Since then the plaintiff had applied to the defendant several times for payment, but had always been refused. The defence pleaded was that the defendant was merely the agent and servant of the Springwell Brewery Company, and that he had ordered the plaintiff to carry out the work by their instructions. Since then the company had gone into liquidation, but the Official Receiver had not scheduled the plaintiff among the list of creditors. His Honour said such a defence was too transparent for him to believe. It was a ludicrous and ridiculous tale. He gave a verdict for the plaintiff for the full amount claimed, with costs, in monthly instalments.

# THE GREAT PROBLEM OF THE XIX<sup>TH</sup> CENTURY.

# VENTILATION

# WITHOUT DRAUGHT.

The hitherto unsolved problem of "Ventilation Without Draught" is to be seen practically illustrated at FREDERICK HENRY SMITH'S Test Room, No. 68, 52 Queen Victoria Street, E.C., Patentee of the Automatic Siphonic Aspirator System of Ventilation. A personal inspection invited.

*Extract from the Annual Report of the "French Hospital and Dispensary," issued 29th January, 1885.*

We have also to return our best thanks to Mr. Smith, who undertook gratuitously to repaint one of our wards and to apply a new system of ventilation of his own invention, which was very successful.

*Letter from David Urquhart, Assistant Engineer to Colonel Sir Francis Bolton, C.E.*

F. H. SMITH, ESQ., 52 QUEEN VICTORIA STREET, E.C.

4 THE SANCTUARY, S.W., LONDON: NOVEMBER 22nd, 1884.

In reply to your inquiry, I have much pleasure in certifying that your system of ventilation as applied to the "Island Room" of the illuminated fountains at the Health Exhibition reduced the temperature during the displays from about 110 deg. to about 70 deg., and thus enabled the men to perform their duties without inconvenience.—Yours faithfully,

DAVID URQUHART.

*Extract from the TIMES of March 14, 1885, page 7.*

"VENTILATION WITHOUT DRAUGHT.—This desideratum appears to be accomplished by a syphonic system devised by Mr. Frederick H. Smith, at whose offices, 52 Queen Victoria Street, London, we recently inspected the arrangement. The air supply is conducted into the apartment from the external atmosphere by means of air ducts, which terminate in distributing passages at the floor level. The exit for the vitiated air is placed in the ceiling, and consists of two tubes, a large and a small one, running parallel to each other between the floor joists in the case of rooms having others over them. In the case of rooms on top floors, or those having the roof directly over the ceiling, the tubes are placed concentrically, but the action and results are the same. The larger of the two tubes carries off the vitiated air, while the smaller one forms an induction tube for cold air, its outer extremity being open to the atmosphere. These two tubes or conduits are so connected that the passage of the heated air through the larger tube induces a current of cold air through the smaller one in a continuous stream. The result is a rapid clearing away of all deleterious gases and products of combustion as they accumulate, and the preservation of a pure atmosphere at an equable temperature in the apartment. In a small room at Mr. Smith's offices in which five large gas-jets were burning, the atmosphere was apparently quite innocuous at the level of about 7 feet, the temperature being about 60 deg. Fahr. At a higher level, however, and especially near to the ceiling, the temperature was high and the air greatly vitiated. It was demonstrated that this vitiated air was being drawn off through the exit tube, which acted as a powerful sucker. After turning off the gas-burners, and upon the temperature of the room generally becoming lowered and equalised, a feeble upward action was still maintained in the upcast tube, but there was no down-draught whatever. The system has already been applied to a church and other buildings with acknowledged success."

## THE "HARDING" VENTILATING COMPANY,

30 EAST PARADE, LEEDS.

### HARDINGS' PATENT AIR DIFFUSER

FOR VENTILATING ALL KINDS OF BUILDINGS.

Diffuser with Filter.

Mr. T. PRIDGIN TEALE, F.R.C.S., M.A., Surgeon to the General Infirmary at Leeds, says of Hardings' Diffuser in his book called "Dangers to Health":—"I am satisfied that by means of this apparatus, we can secure in a town freshness of atmosphere, absence of draught, and exclusion of dirt."

The fresh air is conducted through a grate and aperture in the wall, as shown on section, about 7 feet 6 inches above the floor level; it is then conveyed through the filter, and passed into the room through a series of small tubes placed at an angle of about 30 deg. with the wall.

By these means the currents of air rushing into the apartment are compressed whilst passing through the tubes. The currents of air, as soon as liberated, expand, cut into, and break each other up, and diffuse in all directions so effectually that no draught or chilly sensation can possibly be experienced by the occupants, and at the same time a large volume of pure air is constantly being admitted and dispensed evenly through the apartments.

SECTION

WALL.

**CHURCH WALL VENTILATOR.**—As used in the ventilation of Archbishop Zouche's Chapel, York Minster.

The DEAN OF YORK, with reference to the ventilating of Archbishop Zouche's Chapel at York Minster, says:—"I think the ventilation is perfectly successful, and all I have spoken to about it are well satisfied with it, and much pleased with the result."

**OUR PATENT EXTRACTOR** is the best in the Market, and is supplied at a very much lower price than any other.

**CHURCH WINDOW VENTILATOR.**—These Ventilators are used for Churches, Chapels, and other Public Buildings where it is not desirable to have holes cut through the walls to admit air in the usual manner. The appearance is not more noticeable than the ordinary Hopper Ventilator so frequently seen.

Air Extractor.

"Armley, Leeds, Oct. 29, 1883.

"GENTLEMEN,—I have pleasure in stating that in my opinion your system of ventilation, introduced in our Church this summer, is a decided success. Heretofore when the Church has been well filled at the Evening Service, I have been almost exhausted by the effort of speaking before I have got half through. On Sunday night, October 7, at our Harvest Thanksgiving, we had a very large congregation, and I preached without the least feeling of weariness or exhaustion. I shall be glad to hear that your Air Diffusers are being widely adopted.—I am, yours truly, JOHN GREGORY, Minister of Oak Road Congregational Church, Leeds."

These Ventilators are more suitable for Schools, Warehouses, and other Buildings where cheapness is an object. The result is precisely the same as in our other styles, at a very much smaller cost.

A reduction in price is made where a number of Diffusers is required.

Estimates and further information given on application to the "HARDING" VENTILATING CO., 30 East Parade, Leeds.

# "THE PEDESTAL VASE," JENNINGS' IMPROVED W.C. APPARATUS

(Combination Urinal and Slop Sink).

Registered No. 16,300.

A PORCELAIN VASE set on a tiled or mosaic floor, within walls or a dado of glazed tiles. The usual wood framing, forming a storehouse for the retention and accumulation of *damp*, *dirt*, and *disease germs*, with the joints, crevices, and imperfections in work which the closet enclosure so often conceals, is entirely abolished. The seat is hinged, permitting free access for use as a *slop sink* or *urinal*, and for cleansing, so that the entire apparatus and space can be freely washed down. For this latter purpose the floor should be slightly sunk, and laid to fall to a grating, with waste carried through the external wall, and terminating in a copper flap valve to prevent draught.

The suggestions as regards wall linings and floor, may, of course, be modified as best adapted to the building in which the closets are used; and in the consideration of such details, alternative schemes will readily present themselves.

At the recent **HEALTH EXHIBITION** (South Kensington, 1884), amongst a series of official tests, under the supervision of Baldwin Latham, Esq., C.E., and the Jury No. 9, Class XXIII., and successfully withstood by this closet, the following may be cited in evidence of its efficient action. Being fixed in position shown in illustration, with "**JENNINGS' PATENT SINGLE FLUSH WASTE-PREVENTING SYPHON CISTERN**" 5 feet over, with  $1\frac{1}{2}$  inch down pipe, ten apples (averaging  $1\frac{1}{4}$  inch diameter) and a flat sponge about  $4\frac{1}{2}$  inch diameter were thrown into the basin. The water, as well as the whole of the exposed or dry surface, was first blackened with plumber's "smudge," and the sides covered by four pieces of thin sanitary paper, which adhered closely to the soiled surface. The handle of the cistern was then pulled, and the two-gallon flush liberated. After seven seconds (the time occupied by the discharge), a receiver placed under the trap outlet was removed, containing in the blackened water the ten apples, the sponge, and the four pieces of paper, no traces of the soil remaining visible upon any part of the apparatus.

**GOLD MEDAL AWARDED.**

THESE CLOSETS are already in use in Hospitals, Banks, Hotels, Offices, Private Residences, &c., with most satisfactory results, and, fixed in the manner described, in appearance and action leave nothing to be desired. By the novel arrangement of the supply to Basin, as shown in the sectional sketch annexed, the whole surface is well flushed and cleansed, whilst the bottom of Basin and Trap are thoroughly scoured by a concentrated rush of water which insures the **instantaneous removal** of the contents, thus overcoming the inherent defects in the many imitations recently produced of "**JENNINGS' MONKEY-CLOSET**" (the original form of wash-out watercloset), which was invented and patented by G. J. in 1852.

# The Architect.

## THE WEEK.

THE immense work which is the only contribution of M. GEORGES CLAIRIN to this year's Salon should be secured if possible for exhibition in one of the Bond Street galleries, for it is the most remarkable picture of the year. It is called *After the Victory*, and represents the display of captives, trophies, and treasures before the Moorish king outside the Alhambra. The dimensions are about 30 feet by 23 feet, and it is not surprising to find that the painter's outlay on materials and assistance has been over 500*l*. The canvas and stretching have cost 100 francs; the comparatively simple frame cost nearly 2,000 francs; and the models, who were paid at the rate of 10 francs a day, came to a similar sum. It is calculated that between 150 and 200 tubes of white were used, costing 3 francs each; the ultramarines and other blues have cost on an average from 18 to 20 francs per tube, while for some of the yellows 30 francs had to be paid. Fortunately for the painter's purse browns and blacks cost no more than 3 francs a tube. Several assistants had to be employed at the rate of from 10 to 15 francs a day, and their expenses amounted to 3,600 francs. A picture of this kind is sure to find its way to one of the public galleries in France, but it would be well if it could be seen in England. It displays the great versatility of M. CLAIRIN, whose charming figure of *Frou-Frou* is known in London by means of photography.

How or by whom the injuries were done to the pictures at the Royal Academy still remains a mystery, and various explanations are offered besides that of wanton malice; and it has been suggested that the damage may have been done in dusting the works with feather brushes that have become worn. Mr. THOMAS FAED, R.A., says:—"The senseless and malicious scratching of pictures at the Royal Academy commenced long before the rooms were open to the public. My picture in the second room was frightfully disfigured in the face even before 'the royal private view.' On the morning of that day I spent a couple of hours on its restoration. I visited the room since, and found that another attack had been made on it, the feet and part of the dress suffering this time. My picture *When the Children are Asleep* has also suffered terribly." It is curious, however, that the culprit could have done his work without detection. To leave his mark on one or two would not have been easy if any supervision at all worth the name is practised. A curious circumstance is pointed out by a correspondent, that having narrowly watched the visitors on May 13, he was surprised that not one in the gallery, whether visitor or attendant, appeared cognisant of the scratches, and when the matter was mentioned to an attendant it was evidently news to him. It is too soon, perhaps, to ascribe the work to malice, and even if the explanations—such as that the cat did it, &c., or that the attendants in caretaking did it unwittingly—are untenable, still, short of evidence to the contrary, it will be difficult to avoid thinking it must be the work of a monomaniac or lunatic.

A QUESTION has been raised in the Chancery Division of the High Court of Justice, whether bequests to trustees of an art collection of the late Sir T. C. HOLBURNE, and funds for the endowment of an art museum for Bath contained in a codicil of the late Miss MARY ANNE BARBARA HOLBURNE, executed three days before her death, were invalid, as being private trusts void for uncertainty, and also infringing the rule against perpetuities; or, if valid on the ground that they constituted a charity, whether they were not still invalid as offending against the provisions of the Mortmain Act prohibiting testamentary dispositions of land, or such as involve the acquisition of land. Correspondence showed that the late Miss HOLBURNE had during her lifetime contemplated buying Sydney House, Bath, for the purposes of a "Holburne Museum," and endowing it with 10,000*l*., but the negotiations fell through.

Mr. Justice CHITTY decided on the validity of the gifts, which could, he said, be supported as being charitable bequests. A public purpose of general utility, to the exclusion of private business, was obviously intended by the testatrix, as was shown by the correspondence. It was intended that the museum should be in Bath, and for that city, and kept there. Also, the gifts did not necessarily imply the purchase of a house, for the testatrix seemed to have successfully avoided using any language which would justify any such conclusion. It would be no breach of trust for the trustees to hire a room in which to have the collection in proper and careful custody.

WHEN M. BOUGUEREAU, the painter, announced the death of VICTOR HUGO to the Académie des Beaux-Arts, he had also to announce the loss of another eminent member, M. BALLU, the architect. Perhaps we ought to say architect and painter, for in 1846 THEODORE BALLU obtained one of the medals of the Salon for his paintings. He was an example of a French architect who followed the usual course of practice. A student of the Ecole des Beaux-Arts, he obtained the Prix de Rome in 1840, and in course of time the customary honours followed, until in 1872 he obtained one of the coveted chairs of the Institute. M. BALLU was not a man of one style. The fourteenth-century church of Ste.-Clotilde was designed by him in connection with M. GAU, as well as La Trinité, which is in very advanced Renaissance.

THE funeral of VICTOR HUGO promises to be one of the most imposing ceremonies seen of late years in Paris. There is little or no difference of opinion on the subject, and it may be said that all France is prepared to unite in paying homage to the remains of the greatest of her writers in this century. Never before were so many orders given for floral wreaths. On the Boulevards there is a show of the more expensive wreaths, but in back streets one can also see some of a less costly kind, which have been prepared for humble trade societies and political clubs. The preparations for the public funeral have largely increased the onerous duties of M. ALPHAUD, the architect, who is the chief director of works in the city. It was a happy thought to fix on the Arc de l'Etoile as a temporary shrine for the remains prior to the funeral, and the triumphal arch seems so appropriate for such a purpose that it will no doubt be hereafter used. The avenues of the Champs Elysées, which converge on the structure, allow of the representatives of all the public bodies, learned and political institutions, and deputations from the provinces, to take position, while the long and straight course of the principal avenue will afford a means to display the magnificence of the procession. The openings of the triumphal arch will be draped with black cloth curtains, and in the central part a catafalque 80 feet high will be raised. At each angle will be an enormous "banderole," and around the arch will be thirty-two high braziers, containing a greenish fire. The name of M. ALPHAUD is a guarantee of the becoming style in which the works will be carried out.

UNDER the presidency of the Duke of NORFOLK, E.M., the 42nd annual congress of the British Archaeological Association has been fixed to take place at Brighton on the 17th of August next and following days to the 24th inclusive. By the kindness of the Mayor and Corporation of Brighton some of the principal municipal rooms of the Pavilion have been placed at the disposal of the association during the week's proceedings, and with excursions to Arundel, Chichester, Goodwood, Cowdray, Bognor, Boxgrove, Worthing, Bosham, Wiston, Steyning, Bramber Castle, Amberley Castle, Hollingbury Copse, and other places of interest in South Sussex, there is little doubt but that such a meeting will prove a very successful and instructive one. There will be the usual extra days arranged for the following week, and which will probably include excursions to Lewes, Seaford, Eastbourne, for Hurstmonceaux Castle, Pevensey Castle, and Hastings; a visit, it is also expected, will be made from Newhaven to Dieppe, under the auspices of the Leland Club, thus forming the second excursion to France of that newly-formed antiquarian body.

## RAPHAEL.\*

THE first volume of the new life of RAPHAEL, by MESSRS. CROWE and CAVALCASELLE, narrated the history of the painter up to the time of his arrival in Rome, when, as they said, the world saw "a youth of twenty-three suddenly elevated to the highest rank in the hierarchy of his guild, in whose favour all the oldest and best-tried craftsmen of the Italian peninsula were unceremoniously turned out and sent about their business." The second volume treats of the remaining fifteen years of the artist's life. The advantage of the plan adopted by the authors becomes, if possible, more evident in the continuation of the work. There is little to be discovered about the man RAPHAEL beyond what has been already made known, and it is better to give more prominence to those works which in reality form the story of his life. MESSRS. CROWE and CAVALCASELLE take up his pictures one after the other, and not only tell us all that can be ascertained about the commissions, but they endeavour, with the aid of their unrivalled knowledge of Italian art, to trace the sources from whence RAPHAEL obtained inspiration. He was endowed with marvellous receptivity, and his skill in assimilation was like instinct. With all his genius, it was not possible for him to work out one of his great works unaided. No man could have less resemblance to the *pittori improvvisatori*. Figures by contemporaries, or which had been fashioned by Greek hands, impressed themselves on his mind, and were produced in forms that differed more or less from the originals. REYNOLDS pointed out that when RAPHAEL was designing the cartoons he made use of studies from MASACCIO. Two figures of St. PAUL are copied, but with the material addition of left hands, which were not seen in the originals. A figure of the Pro-consul is taken from the same artist's FELIX, but in one case we see a figure in profile, while the other is a front figure. The President justified the imitation on the ground that "men of superior talents alone are capable of using and adapting other men's minds to their own purposes." Following REYNOLDS, MESSRS. CROWE and CAVALCASELLE have tracked RAPHAEL throughout his career. Knowing that he utilised existing works habitually, they endeavour to ascertain what they were, and then they explain the transforming process. It would have been an invaluable advantage if illustrations could be given to suggest the relations between the various works, but the expense was, we suppose, an impediment that could not be overcome.

When RAPHAEL came to Rome in 1508, MICHEL ANGELO had undertaken the painting of the Sistine Chapel. An army of artists congregated about the Vatican, and it is not surprising that the young painter who required so many assistants was pitted against the great sculptor who was forced to attempt frescoes, and who cared little for assistants or pupils. BRAMANTE was a power in the place, and was known to favour his friend from Urbino, while he was, like so many, in collision with MICHEL ANGELO. Whispering tongues can poison truth, and the sculptor was induced to believe that he was envied by the two friends. He was not a man to remove differences by a gentle demeanour; but he could hardly fail to render a fair measure of justice to RAPHAEL's deserts, although he might be saddened by the conviction that there was a conspiracy to supplant him. The two men lived estranged, and apparently no endeavour was made by either of them or by their friends to bring about a better state of things.

RAPHAEL began with the Camera della Segnatura in the Vatican. His trial pieces were the allegories on the ceiling, although, as MESSRS. CROWE and CAVALCASELLE point out, the logical sequence should have been different. The *Disputa* came after the *Theology*, and the *Philosophy* preceded the *School of Athens*. In the personifications of the virtues and sciences, the composite nature of RAPHAEL's thought is apparent, for "*Theology* recalls Perugia and Florence; *Poetry*, MICHEL ANGELO, Perugia, and the Antique; *Justice* is Umbrian, *Philosophy* Classic." It is plain that the influence of PERUGINO was waning in his pupil's mind, and had been superseded by FRA BARTOLOMEO and DA VINCI. The success of the frescoes was undoubted;

but many artists have agreed with REYNOLDS that the first impression received from them is rather disappointing. The latest biographers, who are never carried away by idolatry, acknowledge that they also have shared in that feeling. "At the first glance," they say, "the venerable remains of RAPHAEL'S frescoes produce a feeling of awe rather than a clear sense of pleasure. There is a hoar of age covering the pictures which conceals in some measure the grandeur and perfection of the work which they embody. But when the eye has become accustomed to this hoar, the first impression of disappointment wears off."

The grandest of all the works in the Camera is the *School of Athens*, and the importance which is given to the architectural framing indicates the relation of BRAMANTE to the painter. It is commonly said that the architect furnished the background, but MESSRS. CROWE and CAVALCASELLE go further, for they believe that BRAMANTE'S influence over RAPHAEL was that of a master in all branches of art. Not only did he advise his countrymen in the selection of ancient models, but he prepared sections of men and horses for his use; afterwards they were adopted as a sort of canon by artists. The mixture of classical and religious subjects in the paintings may at first sight appear incongruous, but the Pope no doubt looked upon himself as the successor of the emperors as well as of the apostle, and the Church always regarded the old fables of mythology with kindly feelings. Parnassus was more than the name of a hill to the cardinals, and RAPHAEL understood their thoughts when he painted APOLLO, and made the god appear to play on his fiddle with the satisfied air of a musician who knew that his audience was made up of friends. We are told that there is no classical statue which corresponds with the figure, and a Greek would hardly think it possible that the god could be so much at his ease. It is less difficult to discover the origin of some of the remaining figures in the *Parnassus*. CALLIOPE, for example, appears to have been derived from the *Apotheosis of Homer*, a relief of which a replica is to be found in the British Museum. RAPHAEL required only thirty months to carry out the whole of his great pictures in the Camera della Segnatura, but although every figure was designed by him, he was assisted in the painting. For the colossal works in the Sistine Chapel four years and a half sufficed, and we may well say there were giants in those days. In the case of RAPHAEL there is the disadvantage that the assistants did not always lose their individuality. Hence so noble a work as the *Heliodorus* manifests two styles. GIULIO ROMANO was the better draughtsman, while GIOVANNI DA UDINE was a Venetian in dealing with colour.

During five years RAPHAEL was painting according to the instructions of JULIUS II., but the accession of LEO X. was the beginning of a new era. MICHEL ANGELO was monopolised by the monument of the late Pope, and his competition was therefore weakened. BRAMANTE was growing feeble, and the vision that arose before RAPHAEL was that of controller of all the Vatican works. People who wish to make little of architecture, or rather of architects, sometimes descant on the ease with which Italian painters and sculptors undertook works of building. RAPHAEL is selected as a notable example. In the backgrounds of his pictures we see graceful architectural details, and the skill that was requisite to produce them was even in the sixteenth century supposed to be a guarantee of constructive power. It is true that RAPHAEL was entrusted with important works, but no advantage was derived by his patrons from the employment of a fashionable painter as a superintendent of building, and it is our firm conviction that the burthen of a task for which he was entirely unqualified hastened the death of the artist. It may be well to recall the circumstances to the minds of our readers.

RAPHAEL was a fellow-countryman of BRAMANTE LAZZARI, and it is supposed that the painter was brought to Rome at his suggestion. It was from the architect, as we have said, that the background of the *School of Athens* was derived, and his figure in the painting, with PERUGINO and RAPHAEL as attendants, is suggestive of the indebtedness of the two men to him. MICHEL ANGELO said that BRAMANTE was the greatest architect of the Renaissance, but between them there was little friendship. There is a tradition that the architect clandestinely introduced RAPHAEL to the Sistine Chapel to see the pictures, for the purpose

\* *Raphael: His Life and Works*. By J. A. Crowe and C. B. Cavalcaselle. Vol. II. John Murray.

of taking hints from them while they were in progress, and it seems to be probable enough. When BRAMANTE felt that his strength was declining and that his hands were too palsied to hold a pencil, he applied for coadjutors in the works at St. Peter's, and selected his rival SAN GALLO and FRA GIOCONDO, the Dominican friar. They were old men (one was seventy-one, while the other was ten years older), and it was plainly his desire that they were only to hold his office until his countryman should be competent to take possession of it. BRAMANTE died in March 1514, and with his last breath he declared to the Pope that RAPHAEL alone was competent to be his successor. The recommendation prevailed, for we know from the letter which the painter wrote to his uncle four months afterwards that he was then in BRAMANTE'S place. He mentions FRA GIOCONDO as his colleague, and says, "I shall learn from him whatever secrets he may possess, and thus I hope to become perfect in architecture." But supposing the ancient friar was too astute to allow his knowledge to be wormed from him by an amateur who did not even belong to his order? FRA GIOCONDO had devoted his long life to the study and practice of architecture, and he must have felt that it would be absurd to expect him to teach a young and busy painter the art and mystery in a short course of easy lessons. The master key was to be found in VITRUVIUS, and what could be expected from a pupil who was unable to read a Latin book?

In the work before us it is said that FRA GIOCONDO died in 1515, but he appears to have been living in 1517, when he published a new edition of "Cæsar" with a design to illustrate the bridge over the Rhine; and the manuscript found by FRA PUNGILEONI states that in 1518 the friar was receiving 25 ducats a month for his services at St. Peter's, a similar amount being received by RAPHAEL, while SAN GALLO had only 15 ducats. We think it may be concluded that the responsibility for the works was shared by the friar for more than a year. RAPHAEL'S greatest feat was the proposal to abandon BRAMANTE'S plan of St. Peter's, and to substitute a Latin for a Greek cross. For a time it is evident that he was absorbed by architecture; but Messrs. CROWE and CAVALCASELLE in the following passage suggest the doubts which beset the student when one seeks RAPHAEL'S buildings:—

When we strive to detect what Raphael produced as an architect we get upon difficult and perplexing ground. Vasari himself is obviously puzzled to define what Raphael accomplished. In some places he speaks of architectural designs furnished "at the Villa Madama and at palaces in the Borgo," and amongst the edifices which he particularly mentions is the palace of Giovanni Battista dell' Aquila. In other places he speaks of "designs sketched" for San Giovanni of the Florentines at Rome, San Lorenzo and the Palazzo Pandolfini at Florence. In a third series of passages Raphael is described as "ordering" the architecture of the Chigi stables at the Farnesina, and the chapel of the Chigi in Santa Maria del Popolo at Rome. To interpret the first of these forms of expression in Vasari, the buildings to which he alludes should be visible. They have, unfortunately, perished with the exception of the Villa Madama. It is curious that all the drawings for that villa in the Uffizi are made to scale by Antonio da San Gallo, and the only share which can be assigned to Raphael would be that of a general sketch such as his fancy might evolve and a clever assistant work out. The second form includes one doubtful success and two failures. Raphael's designs for the churches of San Giovanni of the Florentines and San Lorenzo were not accepted. That of the Pandolfini Palace, though full of grandeur, was not begun till after Raphael's death. An interesting passage in Agostino Chigi's will refers to the chapel of the Popolo, which was still unfinished at the banker's death, but was to receive completion according to an arrangement or *ordinatio* previously determined by the testator, and of which Raphael and Magister Antonio da San Marino were fully informed. The word *ordinatio* closely resembles Vasari's "*ordine*." It appears to suggest some species of decoration, as well as the building of an edifice. It is therefore a question whether Raphael planned the Chigi Chapel at the Popolo, or only suggested its internal adornment.

RAPHAEL tampered with BRAMANTE'S construction with as much hardihood as he altered the plan of St. Peter's. He added a third storey to the Loggie in the Vatican, and it was only by closing the openings in the lower storey that the structure was saved from destruction. But he was still ambitious to be esteemed as a many-sided man, and the fear of other failures haunted him and depressed his mind. There

is a remarkable letter addressed to the Duke of FERRARA by his agent in Rome, who was endeavouring to obtain a picture from the painter which he had undertaken. "The matter of RAPHAEL is still unsettled," he writes, "I shall attend to it, but first mean to try kind measures, for men of this excellence all suffer from melancholy, and RAPHAEL the more because he clings to this question of architecture and does the BRAMANTE, and would like to take the art out of the hands of GIULIANO LENO." The latter was a sort of factor or administrator of the works at St. Peter's, and it is evident that the painter wished to have control of every department—financial, artistic, and constructive. In truth RAPHAEL assumed a load that, like WOLSEY'S, was enough to sink a navy, and it is not surprising that he sank beneath it. His fate should be taken as a warning by amateur architects.

In contrast with RAPHAEL'S eagerness to strut as an architect is his sensible conduct in respect to sculpture. Every one who has seen the group of the dead boy borne by the dolphin, forming part of Sir HARVEY BRUCE'S collection, and which tradition has ascribed to RAPHAEL, would say that it was a creditable work. Messrs. CROWE and CAVALCASELLE believe that it was not a work by his hand, but an attempt to realise one of his designs. It has the characteristics of the master, and it suggests that RAPHAEL could have works produced in marble which, if wanting in grandeur, would at least be pleasing. MICHEL ANGELO was warned of RAPHAEL'S efforts to model figures, and knowing that his own works were not appreciated, he may have been irritated at the thought of prettiness over-coming the sublime. But RAPHAEL'S good sense controlled his ambition, and not more than a few figures are associated with his name. He recognised his limitations. In architecture it was otherwise, for he hoped to outstrip his contemporaries. He told CASTIGLIONE that he was not satisfied with producing a model which insured the approval of the Pope. "I aspire," he said, "to something more. I am desirous of finding out the beautiful forms of the ancient buildings. I do not know whether my soaring will be that of ICARUS." But the ancient secrets are not to be discovered so easily, as RAPHAEL, like many an amateur before and since his time, discovered when it was too late.

The works of RAPHAEL in which we can take most interest are the cartoons, although it must be said that the gallery containing them is generally the most deserted by the visitors to the South Kensington Museum. For our readers they should have additional interest, for they owe their origin to builders. The works at St. Peter's were delayed, and the masters of ceremonies were distracted in endeavouring to conduct grand services and pageants in a temporary building and surrounded by scaffolding. The happy thought struck one of the officials that the Sistine Chapel should be used on those occasions instead of the basilica, and that instead of the gaudy hangings which are still used abroad, the walls should be draped with tapestry. A commission was given for ten designs (some say eleven), of which we have seven in London. The cartoons have been a theme for so many dissertations it is difficult to say anything that is new about them. Messrs. CROWE and CAVALCASELLE analyse the figures with care, and the following extract will suggest the breadth of view with which the process is undertaken:—

Raphael's cartoons are the mature fruit of the studies of a lifetime. They mark the close of a brilliant period of Italian art, which opened with Giotto, and includes Masaccio, Ghirlandaio, and Leonardo. Unlike the ceiling of the Sistine, which is an incomparable result of Michel Angelo's individual striving, it distinguishes Raphael from his rival by showing that originality could be attained by a judicious study of extant masterpieces controlled by repeated appeals to nature. Each picture in the series displays the highest possible skill in composition. Where action is required, it forms a material element in the arrangement; where it is not required, its place is taken by variety of expression or contrasts of movement and position. No general or inviolable rule is applied without exception. The subject dictates the form best suited for its display; and the narrative is never obscured, however complex the motive idea of the picture may be. Attitude and gesture, always elevated and pure in accent, yet full of modulations, constantly remain within the limits of reality. The type, the strain, or the turn of expression may differ, but the design invariably comes out without a blemish. With an intense concentration of life and dramatic force, every sentiment, every passion is manifested,

and this applies with equal facility, and regardless of beauty or ugliness, to childhood, manhood, or age. It was a condition precedent that Raphael should have studied nature in its best models and the antique in its most ideal shape, and assimilated all the materials which that study afforded before he poured forth the treasures which he had laid up. That his pictures sometimes recalled the Classic Greek and Roman, Masaccio, Filippino, Leonardo, and even Michel Angelo, was the necessary consequence of his method. But these reminiscences never clouded work individual in stamp and Raphaelic in impress. It is in the cartoons, and in these only, that Raphael created a type of the divinity of Christ, which gives him a place in the annals of art on a level with Da Vinci. For, whilst Da Vinci produced the Saviour in the highest form of serenity as the God-man who knew that He was betrayed and about to suffer, Raphael gave shape to a form of equal grandeur and majesty in the Saviour of the Resurrection. The shapes of the Apostles were wrought with a power and clothed in a halo of dignity and sanctity never before attained, and only surpassed by that of Christ Himself. Descending from these, perhaps, too lofty contemplations to the commoner elements of Raphael's art, we acknowledge equally his great skill in bringing freshly before us a world then sixteen centuries old, a result which was compassed not only by a finished definition and rendering of nude in every detail of contour or play of muscles and articulations, but by a thorough mastery of the models of antiquity. With this the most delicate and exquisite sense of chords of colour and balanced light and shade were combined, and the harmony of a style in all its parts established.

Here we must stop. In conclusion we recommend the two volumes to all students of art history who care for careful research and just conclusions about the works of one of the greatest of those artists who were given as a blessing to humanity.

## NOTES ON SOME ENGLISH CATHEDRALS.

[BY A CORRESPONDENT.]

**W**INCHESTER Cathedral is an admirable example of vigorous architecture carried out in the Perpendicular style. For the solidity of the features of the cased Norman work does not injure the Perpendicular detail, which is equally adapted for bold treatment or for the most delicate handling, as may be seen in the case of the tabernacle-work ornamentation to the grand old altar screen. This adaptability is a characteristic of Perpendicular architecture which is not generally sufficiently realised. The very great thickness of the aisle walls should be observed, which has afforded the opportunity of moulding the window jambs and mullions as well as contriving deep reveals internally. Although the capitals and the mouldings thereto of the nave arcade are delicate in scale, the arches possess mouldings which are, on the contrary, bolder and much larger in proportion. Yet the general effect is pleasing. In the choir, however, the mouldings to both the capitals and arcade are of about the same scale. It would be difficult to equal the simple grandeur of the severe massive Norman work in the north transept. In the beautiful tomb of Bishop WILBERFORCE, designed by the late Sir GILBERT SCOTT, there is one architectural detail that seems out of place and un-English. I allude to the twisted shafts which have been borrowed from North Italian Gothic work. In the new oak screen to the choir (almost a replica of the choir stalls) the want is felt of a distinct horizontal line behind the canopies, &c. It is surprising what an amount of delicate fine ornamentation can be piled on without appearing redundant in such an elaborate screen as this. What can be better than the work to these beautiful stalls? The ornamental forms being simple trefoiled heads, cinque-foils, &c., are at least quite as effective as the more complicated details of later architecture.

Externally, the lowness of the central tower is scarcely pleasing. It is to be hoped that some day what was doubtless the original design of the Norman builders may be carried out, namely, a pyramidal roof of timber covered with lead. This addition would aid much in expressing the desirable element of height. Such a feature was suggested some years since in the case of another great Hampshire church, that at Romsey, where there is also a low central Norman tower, at present surmounted by an incongruous-looking turret of comparatively modern date. It is hardly

possible to quit Winchester without saying a word about St. Cross, now practically a suburb of that city. Whatever plan of church has been, is, or will be adopted, it is difficult to imagine anything superior to the cruciform for both external and internal effect, and in our modern churches we rather suffer from being unable conscientiously (as regards the adaptation to the ritual of the English communion) to follow out that type. At St. Cross, as at Winchester Cathedral and numberless other old churches, one can revel in the charms of thick walls, and when the bright sun pours in, watch it playing on the long deep splays of the interior of the windows. The broadly-splayed window recesses, and the very redundancy of strength in these old walls, become suggestive of reserve of power, and are most impressive.

Exeter Cathedral is a good specimen of a Mediæval structure that is well adapted to the services of the Church of England. The nave and choir can be used for worship separately or together, except for the Holy Communion, as there is only one altar. Both, however, contain proper choir-seat arrangements.

It is pleasant in these days, when there is so much materialism, to see such a poetical conception of sculpture to a pulpit as in that to the nave of this cathedral. In the *Times* of October 19, 1877, it is thus described:—"Between figures of ST. PAUL, ST. JOHN THE BAPTIST, and ST. STEPHEN are sculptured panels of which that in the front represents the body of the martyred bishop (Bishop PATTESON, a Devon man) carried by three natives to the boat in which it was found. The northern panel has the martyrdom of ST. ALBAN; the southern, the departure of ST. BONIFACE (a native of Devonshire) on his mission to Germany. The body of Bishop PATTESON is shown wrapped in a mat of palm fibres, and, as it appears, the palm branch, with its five knots, is supposed to indicate the murder of five natives avenged by that of the bishop." Both in this pulpit and in that at Salisbury shafts are set centrally under the steps, thus leaving the space beneath comparatively open—a great advantage when interruption to view is undesirable. At Salisbury the hand-rail is fixed on the side next the nave pier, near which the pulpit is placed, to be as little conspicuous as possible. As a rule, the balustrade to a pulpit staircase is not a pretty object, however ornamented, and, except in high pulpits, its absence is to be commended. Where there is no handrail, good solid stone steps with a wall under them, and a slightly raised coping, to give the idea of security, are to be recommended. The tracery to the windows of the choir and choir-aisles at Exeter is superior in design to that of the nave and nave aisles. It is also of earlier date than the latter. We do not find here the rigid, straight lines at oblique angles, or spiky forms, but more harmoniously composed outlines, portions of circles, &c. I am not comparing the vertical and horizontal lines with curved ones, for I think that in some windows of the Perpendicular period there are admirable examples of the consistent treatment of stone. I am rather alluding to the eccentric form of tracery sometimes found in late Geometric Decorated work.

The piercing of the old organ screen, and the treatment of the backs of the "return" stalls, which are left apparently quite open, with a perforated stone screen behind them, appears to me very successful. A little of the solid effect obtained by the dark oak backs to the stalls is missed, and if one is disposed to be hypercritical it may be said that it was scarcely worth while to go to all this trouble and expense of canopies and yet leave them open for draughts behind. I believe, however, the latter objection is met by plate-glass, as in several other apparently perforated screens, at Wells Cathedral, for example, and elsewhere—a pious and harmless deception. In exchange for the shadow of the overhanging canopies is a greater lightness and a softening down of the shade. The late Sir GILBERT SCOTT generally moved with the times, and at Exeter endeavoured to adapt the Mediæval treatment to modern requirements, so that the worshippers in the choir aisles might really take part in the services. The old Renaissance organ-case, of the date A.D. 1665, is really not out of harmony with the Gothic surroundings. There are a number of obviously sham pipes, small and great, to the front; but there seems no harm in these: they are but suggestive of the real pipes

inside, which, if visible, would look ugly. In the furniture it can be seen that everything has been designed by the architect, and very little of the designing has been left to the modern metal-worker. The old pendants, though not exactly Gothic, and the ornament of which mainly consists of simple twists (after all, the most natural treatment of metal-work), are excellent; the candelabra standards within the brass altar-rails are almost Italian in feeling. It is at any rate an advantage that all the choir-lighting arrangements are for candles not for gas. In a cathedral one does not want or expect the glare of a theatre or concert-room. All that is requisite is that the lighting shall not look paltry, and that it is sufficient for people to read easily. Candles are more costly, but in a cathedral where thousands have been spent in enrichments, that objection ought to be immaterial. The reredos, delicately gilded and enriched by coloured marbles, has just a sufficient tone of colour to suit the eastern end of this grand old building, while the exquisitely worked altar frontal is a very fine specimen of the embroiderers' art. As far as the effect of the sculpture to the reredos is concerned, I think it would be an improvement if the field or ground was gilded in some flat manner to throw up the figures better.

It is a pleasure to the thoughtful architectural student or inquirer to find all the fittings of the choir so carefully looked after even to the minutest detail. I regret, however, to make one exception—the flimsy-looking metal grilles at each end of the reredos which are gilded and coloured a very crude blue.

The carved convex ornament, an amplification of the four-leaved Decorated flower in the west central doorway, gives one the idea that it has been worked in separate pieces and fixed in afterwards. This is actually the case at Wells Cathedral in the west front, where some of the delicate carving and figures to the arch mouldings of the doorways are in white lias, the general work being of Douling stone. If executed in one solid stone it must have been very laborious to carve, though very effective when done.

The litany desk, at Exeter, is for the use of two minor canons to chant together, an old custom kept up in some cathedrals. This makes it more important and larger than the usual litany desk for one clergyman. How much more agreeable is the contrast here in the nave arcade piers, where the bluish-grey, unpolished stone is in combination with the Beer freestone, than in the case of Salisbury Cathedral. The low, octagonal pedestal, with a broad, flat ledge on the top, sufficiently wide to permit of its being made use of as a bench if wanted, on which the clustered nave piers rest, is a pleasing feature. Above are the bold vaulting ribs, with the beautiful reddish and bluish-brown filling-in to the cells, mottled in much variety. For a combination of self-coloured, natural materials, harmonising well together, I scarcely know a better example. Restoration is often condemned, but this bringing back of the tinting to its original state is a wonderful improvement in this instance.

#### PARTRISHAW CHURCH.\*

F. R. KEMPSON, F.R.I.B.A.

PARTRISHAW has, I believe, been described as a late church, not earlier than the fifteenth century; but when speaking of a little chapel or Bettws in a mountain district, it is, I think, by no means safe to say that it must be a late one, simply because no early architectural features have yet been acknowledged to exist in main structure. Such features are, in little churches among the mountains, not unfrequently conspicuous for their absence or lie hid for centuries. Many such churches and chapels—built, I believe, at quite an early date—possess no mouldings or architectural features in the main structure from which the date can be definitely determined. Such early churches had mere slits in the walls for light, and these have been enlarged and made into windows. I see nothing here to prove that the nave at least is not Norman, with late windows introduced, and I am inclined to think it is so. The nave has very remarkable fine stone quoins; the one at the south-west angle batters inwards on both faces, and the wall has a fine "spur base." These features are quite charac-

teristic of very early work. On the south side of the nave is a small square-headed window, set high to light the rood loft. The chamfered head of this window is rounded off into the jamb in an unusual manner, as is also the sill. It is worth examination. The jambs may have been those of an earlier window. In the west wall of the nave, to the north of the western chapel, is another square-headed labelled window with jambs of a hollow section; this is a late window. There is an ugly square-headed window in the south wall of the nave to the west of the porch, the head of which should be examined; it looks as if it might have been the head of an early two-light window from which the mullion and centre part has been cut away. The large three-light window on the south side of the nave is characteristic of the same period as the roodscreen and loft, as is also the window with two lights in the east end of the chancel, which has carved terminations to the hood mould. There are two square-headed windows and a priest's door in the south wall of the chancel, and two brackets in the east wall, which are very small and low for figures. They may be the corbels that carried a credence slab.

The porch, which is on the south side of the nave, is very plain and rather large. There is a stoup by the door the head of which seems to have been the head of a thirteenth-century window. There are stone seats on either side, there is also a stone seat against the outside of the south wall of the nave, as well as another at a higher level against the south wall of the chancel. The bell-cot is a stone gable with a pent-house behind it; it is constructed for two bells, and is erected on the west gable of the nave.

The roof of the nave was probably reconstructed early in the sixteenth century; it is coved to an irregular curve with moulded ribs, and there have been bosses at the intersections. The cornice, which is very deep, is moulded with a number of roll mouldings, but projects very slightly. The section of the mouldings suggests that the introduction of carved enrichments was contemplated between the rolls. The chancel roof is flat and ugly; it is not improbable that it is fixed under the rafters of an earlier roof.

The entrance to the rood loft is from the nave, on the north side, by stone stairs built in the wall. The little window which lights the stairs is perhaps formed out of the jambs of a thirteenth-century window.

The rood screen and loft form the grandest feature in the church. It was erected probably quite early in the sixteenth century, and is certainly one of the finest specimens of the kind in the country. There were many fine oak screens in Breconshire and the adjoining counties, most of which have been mutilated or have fallen into decay, so that what remains of them is, as a rule, very fragmentary. Few of these screens were as beautiful as the one at Partrishaw, with its elaborate courses of carved foliage and ornament in its moulded beams, of which there are two on the head of the screen itself, four on the lower beam of the rood loft, and two on the beam above the seventeen panels of open tracery, which are fixed between moulded mullions and form the front of the rood loft. The beam over these panels has large holes cut in its top at almost regular intervals, which indicate that there probably was another enrichment over it. Except the screen at Llangoom, near Usk, I have not seen anything to compare with the one at Partrishaw. There was no doubt a cove with moulded ribs and carving between the head of the screen itself and the enriched beam under the rood loft, as at Llangoom, but more flat.

There are two original stone altars against the western face of the rood screen near the north and south walls; some of the crosses may still be distinguished on them.

The curious font is large and circular with a narrowed circular base of rough masonry plastered over, which stands on a broad circular base also of rough masonry, covered with thin slabs. The upper part of the font measures 34 inches in its external diameter, the basin being 20 inches in diameter, with an excavated drain. The outside of the body of the font is quite plain, but upon the flat ridge of the top of the font is the inscription "Menhir me fecit i(n) te(m)pore genillin," consisting of rudely-formed letters of irregular size, being for the most part Anglo-Saxon minuscules. On either side are two holes for the staples for the cover, and also two semi-foliated ornaments, extending into a line which runs all round within the outer edge and encloses the inscription. The font is coeval with the dedication of the church in the year 1063, and this is of considerable importance, as we have in this inscription round its top a very different style of letters either from the debased Roman capitals of Paulinus and the other earlier stones, or the Hiberno-Saxon characters of the Llantwit and other similar monuments. The system of contracting the words wherever possible had also commenced.

On the west wall of the nave is painted the full-size figure of a skeleton in red, holding a dagger in the right hand, an hour-glass in the left, and scales suspended from the left arm.

The western chapel or recluseorium is not, I think, coeval with the church, but built at a later date, *i.e.* in the thirteenth century, with subsequent alterations. It is built against the

\* From a paper, "The Church of Partricio or Merthyr Ishew (or Ishew the Martyr)," read before the members of the Woolhope Naturalists' Field Club.

west end of the church without being bonded into it, its south wall being in line with the south wall of the nave. There is a stone altar at the east end of the chapel, the south end of which abuts against its south wall. Upon examination it will be found that the altar slab most probably occupied another position before it was erected here. The base of the altar is of rough stone walling, plastered over. There is no indication of its having been added to at any time, but the top of the altar is formed by an altar slab which is not nearly as large as the present altar, the extra space being made out by a second stone at the south end and a little plaster to make it good up to the south wall. The original altar slab has the usual five crosses upon it; it has also a sixth cross towards its north end, which has all the appearance of being original, but I have never met with a case like this before. When this altar was arranged as it now stands, the square opening over it was probably cut to bring the high altar of the church in view from the chapel. The head of this opening is rounded off into the jambs like the head of the window which lights the rood loft. In the east wall of the chapel, north of the altar, is a cinquefoil niche for a figure, and there are two steps in front of it, the lower step, which is in line with the altar, being about 14 inches high; this is a pretty clear indication that there was a footpace all across the chapel in front both of the altar and the niche. The entrance to the chapel is by a plain-pointed door in the south wall; there is a small window in the west end now walled up for a modern fireplace and chimney. I wish to call particular attention to it, for it has been described as a fifteenth-century window. I am clearly of opinion, however, that it is of thirteenth-century date. In the south wall, east of the doorway, there is a very good fourteenth-century single-light window well cusped, and there is a modern window west of the doorway. There is a good plain roof to this building, which is frequently called a recluseorium; but it is, I think, a chapel, and I see nothing to justify its being called anything else. The position is certainly unusual, but it would have been difficult to add a chapel of such a size to the old church in any other position, for the ground on the north side of the nave has been excavated out of the side of the mountain, and deposited on the south side. A chapel could therefore not have been added towards the north or south without great trouble and expense; indeed, on the south side I think it would be hardly possible to make a secure foundation on the "made ground."

I believe we have at Partrishaw some remains of a Norman nave. Alterations were made, I think, in the thirteenth century, and it was then, I believe, that the chancel, the western chapel, and south porch were added, the single-light window to the east of the doorway of the western chapel being inserted in the fourteenth century; then, when the rood loft and screen were erected, which was probably soon after the year 1500, the east and south windows of chancel, the priest's door, the three-light window of nave, the doorway leading from porch to nave, and the stairs for the rood loft were introduced. It was then also, in my opinion, that the present arrangement of the altar in the western chapel was effected, the opening cut over it, and the niche for the figure introduced.

The repair of the church which is so full of interest for archaeologists is, I believe, contemplated, and I understand that it is to receive such careful conservative treatment that we may rest content it will stand for many a long day to interest future generations, and show them what care has been bestowed upon it, not only by those who built and enriched it in Mediæval times, but by those, too, who in this nineteenth century have, and will have, the responsibility of maintaining it with all its interesting features and details, telling its own history to them as it now does to us.

## TESSERÆ.

### Venetian Painting.

SIR C. L. EASTLAKE, P.R.A.

IT is strange that I never dwelt on the system of the Venetian school till I had myself discovered the way in which nature herself atones, if I may so say, for this want of light and shade in hot countries. In short, the character of nature here, and in the works of Titian and others, is to produce light and dark by colour, the noblest and most general system of imitation. In Greece the sea and sky are sometimes the darkest parts of the general picture. The monotony of a sandy ground is relieved on one side by the sparkle of marble, and on the other by the depth of the cypress and evergreen oak. So much for inanimate nature; but we find the deep rich tones of men and animals, and even the dresses of the first, all combine to make amends for the want of that shadow which the northern climates have without colour. The Venetians, therefore, formed their style from the study of Italian nature. In all the pictures I have sent to England I have put in practice the system I endeavoured to describe. There is very little light and shade

(except in the landscape), and a great deal of deep colour. In a hand, for instance, by the time the half-lights and shadows are done (both differing from the colour of the light), the mass of flesh colour is lost. In the Venetian pictures and in nature looked at largely, the local colour ends only with the outline; and, to give the utmost quantity, the Venetians make the outline also warm. This, I consider, forms a considerable part (applied to everything) of the breadth of colour so admired in Titian.

### Heraldry and Architecture.

J. B. WARING.

Amongst other useful accessories to architectural ornament, the employment of heraldic and other insignia has fallen into nearly complete disuse at the present day, except in the case of buildings in the Gothic style; and we consider it a great loss, for both in point of utility and ornament they are very valuable. A shield of armorial bearings very often decides at once the date of a building and the person by whom it was erected. Thus the *Biscia* of the Visconti, the *Palle* of the Medici, the winged bull of St. Mark, the Florentine lily (*Giglio della Comunità*), the Tudor rose and portcullis, the *Nodo* of Alonzo el Gabio, the sheaf of arrows of Isabella la Cattolica, all speak as it were to the spectator, and tell him the origin of the building on which they are found; nor are they less useful in the case of particular individuals, whose family history they often serve to perpetuate. In Italy and Spain examples of their application as ornament abound. Originally they were placed in a central position; in some cases they were used as a frieze, or between the spandrels of arches, and in the Florentine palaces of the fifteenth and sixteenth centuries were applied with good effect as an angle ornament. They were capable of very varied treatment. Designs of a florid character are to be found in the *petits maîtres* of the German school particularly, to which the student is referred, assured as we are that, not in this particular case only, but in several other subordinate ornamental features applicable to architecture, he will find therein many valuable ideas. We would suggest that any mottoes or inscriptions connected with them should be made with inlay, instead of being engraved, for the sake of its superior durability.

### Greek and Gothic Architecture.

HARTLEY COLERIDGE.

The Grecian temples and statues are only antique from the accident of being ruined or mutilated. Had we (and who will say that we never shall have?) artists capable of reproducing them, they would belong as much to the present age as to that of Pericles. The principles of grace upon which they are founded are no more Grecian than British. The Greeks, it is true, had the merit of discovering them, but anyone may adopt them who can; they are never out of place, never out of date. But a Gothic cathedral is antique, though entire; dilapidation is not needful to give it age. Should a modern architect succeed in rivalling the hallowed structures of our forefathers (an event by no means probable), still his workmanship would savour of the times of yore, of other men than we, other manners than ours. We should feel the new stone and stucco-work, the freshness of youth upon the new wonder, somewhat painfully, and in a fanciful mood might marvel in what cavern of the earth it had been hidden so many centuries—by what mechanism it had been raised. It is seldom safe to imitate antiquities; an antiquity that is not ancient is a contradiction. It reminds us of something that it is not. The charm is gone. It is like the tragedy of "Hamlet" with the character of Hamlet omitted. In great works it is well to keep close to the eternal—to that which is never modern, and never can be antique. But it is impossible to exclude the spirit of our own age, and, therefore, to mimic that of another can only produce incongruity.

### Russian Mosaics.

PROFESSOR ARCHER.

The first operation in preparing to copy a large picture in mosaic is to draw it on paper, or canvas in outline; then it is divided by lines into squares the size of the tesserae, and these are coloured in with water-colours. A very strong wooden frame is then prepared; those I saw in use were of balks five inches in thickness, and about six or eight inches in depth, well clamped with iron at the angles. This frame is laid on a smooth stone table and is filled with mixed plaster of Paris, which is then left to harden and dry, after which it is turned over, and the surface which was next the smooth table is found to be nearly perfect, and is rendered quite so by scraping and other operations. Upon this an outline of the picture is then drawn, and lines ruled at right angles so as to form squares corresponding with those on the cartoon, and the artist proceeds to set the tesserae. In order to do this he begins to cut out the stucco within the outlines of the drawing one square at a time, sufficiently deep to take a quantity of mastic, made of powdered marble and oil, into which he presses the tesserae, keeping the upper surface perfectly level. In this way he

works through the whole picture, which is then turned over and laid with its face to the stone table. All the stucco is then carefully removed from the back until the rough under surfaces of tesserae are exposed. Roman or Portland cement is then run in so as to form a solid back to the picture, which after being cleaned is ready for removal to its destination. The smalts or glass enamels are manufactured at the Imperial Porcelain and Glass Works, and are supplied to the mosaic factory from time to time as wanted. They are in round flat cakes four or five inches in diameter, and three-quarters of an inch in thickness. A small apparatus formed of six cutting wheels worked by a lathe, the wheels of malleable iron, covered with tin and coated with emery, set at equal distances on an axle, slits the cakes into strips of equal width, and these are then cut transversely or diagonally, as the artist requires, with great ease by means of a file and chisel. Smaller ones are made in the same way, but the smallest are drawn out into square rods and broken to the lengths required. The gold tesserae are made by taking heated plates of glass, three inches square, and covering their upper surfaces with gold leaf; then upon this is placed molten glass, which is pressed on with a copper plate till it forms only a thin even layer. They are next carefully annealed, and are then fit for use. The Byzantine character of the Russian mosaics involves a great cost, from the larger quantity of gold tesserae employed.

### Thirteenth Century Village Churches.

G. E. STREET, R.A.

You must not imagine that it is only in great abbeys and cathedrals that the thirteenth century was so fertile. On the contrary, little village churches in all parts of the land illustrate the same possession of power on the part of the country architect or mason that we see in those who built the former. I know no examples more interesting than these, whether you take the Sussex village church, with its intensely simple lancet windows, its coved wooden roof, and its shingle spire, or whether the Northamptonshire churches, built of good stone, with much rich decoration in their detail, and adorned with towers and spires which are the pride of the whole country; in all you will find the same extraordinary equality in detail and harmony in character. They bring before us the especial glory of England—the small village church in perfection; and there is one feature in them which one may almost say is unsurpassed elsewhere. This is the steeple. Usually it is placed at the west end of the church, and surmounted by a spire. The outline of this is always of the most severe kind—an octagon placed on the square tower, with very simple spire-lights on the cardinal sides only, and a steep slope, and sometimes small pinnacles connecting the octagonal base of the spire with the square outline of the tower. Here, as in most works of the period, the effort seems to have been to obtain as simple and graceful an outline as possible, and to construct the work so that there should be as few elements of decay in it as might be. In later times, though the early broach spire was sometimes copied, it was much more usual to add parapets, flying buttresses, and complicated pinnacles at the base of the spire, and thus at the same time to destroy the simplicity and diminish the stability of the work.

### French and English Portals.

SIR G. G. SCOTT, R.A.

The great glory however of the French churches is their doorways, and beautiful as are those of our own, they make no kind of pretension to vie with those of our neighbours in magnificence. In this respect the architects of the two nations seem to have gone on quite contrary principles, for the French even in buildings on the secondary scale introduced portals of prodigious size and extreme richness, while the English even in buildings on a grand scale often made their doorways very inconspicuous. Compare, for instance, the façades of Amiens and of Wells—in one the portals are everything, so that you can recollect little else, and in the other they are nothing, and you can scarcely recollect their existence, while in the façade above the English example is the richer of the two, and the illustrative sculpture which in one case is expended on the portals is in the other diffused over the entire front. In England a magnificent portal is of rare occurrence, in France one looks for it as a thing of course. Nothing more glorious than the great French portals can be conceived; the lofty and deeply-receding jambs are divided in their ample height into two portions, the pedestal or basement of which is richly decorated either with diaper-work or with sculptured medallions, or, as at Amiens, with both, and the upper stage contains colossal figures of apostles or other holy men of old, who appear to view with severe and solemn benignity the entering crowd, and to express by the gravity of their countenances the caution, "Keep thy foot when thou goest to the House of God." In the tympanum are sculptured scenes from Scripture history, the lives of saints, our Lord surrounded by the evangelistic symbols, or perhaps the awful scenes of the final judgment, and

the mouldings of the arch are probably filled with angelic figures as if the guardians of the faithful worshippers, while this impressive array of imagery is placed in a setting of the noblest and most perfect architecture, and that on a scale well suited to the sublimity of the sentiments expressed.

### The Stuttgardt Building School.

J. SCOTT RUSSELL.

Some of the most distinguished directors of the technical university represented to the Government the expediency of forming a new school, intended for building crafts and tradesmen of the rank immediately under the professional men and skilled masters of the technical university. That was accordingly established, and succeeded so quickly and so completely that it became necessary to erect quite as large and as handsome a building, and to devote quite as large a staff to that purpose as to the original polytechnic university. It is now one of the most remarkable and meritorious schools on the continent. The men whom it was especially designed to help in their trades were stonemasons, bricklayers, and carpenters, to be trained for future master builders; lower class builders to be trained for master builders, constructors of public works, subterranean works, and constructors of reservoirs; constructors of waterworks, river-works, and mill-works, and land surveyors of the first and second class. The general workmen whose education it undertakes are plasterers, tilers, roofers, joiners and carpenters, glaziers, turners, decorators, ornament-sculptors, modellers, engravers, smiths, gold and silver workers, gardeners, and husbandmen. Its great merit is its perfect adaptation to the wants of each separate class of persons. For young men who are much employed in winter, and less in summer, it provides summer courses of study, and gives them vacation in winter and *vice versa*. It has classes in the early morning, the same at mid-day, and the same over again in the evening, and the hours of the different classes are so timed that the pupil may attend many or few hours of the day and still obtain the studies he requires. This school is presided over by the most distinguished architect of Württemberg, with no fewer than 28 professors and masters under him. Systematic courses are provided for those who can go through the education required to obtain certificates of competence, and their estimation of its value is proved by the fact that the school is crowded by exactly that class of men whom it was intended to benefit.

### Capitals of the Ducal Palace, Venice.

C. C. PERKINS.

Now we come to the carved capitals of the thirty-six columns upon which the edifice rests. They, too, have for the most part their separate as well as their connected meaning, though the sculptor apparently allowed himself a certain freedom of invention. They represent the conditions of man, the animals and plants needful for his existence and comfort, the planets which preside over his destiny from the cradle to the grave, and the winds which purify the air and propel his ships across the sea. The capitals beginning at the Raphael end of the façade are sculptured with figures of children, heads of young knights and warriors, birds, emperors (amongst whom are Titus and Trajan), women's heads, virtues and vices, symbolically represented; wise men, such as Solomon, Aristotle, and Pythagoras; the planets Saturn, Jupiter, Mars, and Venus; the patron saints of sculptors, each working upon a capital, a cornice, or a figure; the trades, such as those of the lapidary, the carpenter, the husbandman, the blacksmith; the seasons, with their varying occupations; the ages of man represented by the infant, the schoolboy, the warrior, the student, and the old man leaning upon his crutch, and dead upon his bed; the courtship and marriage of a young man and woman, who are again represented with their child, first an infant, then a youth, beside whose death-bed they are weeping and praying. Last of all, we come to the column of Justice, which stands below the Judgment of Solomon and the statue of Gabriel. Its capital, which is the finest of the series, is covered with the richest leaf work, growing upward from its base and drooping in graceful volutes, between which are inserted figures of Justice seated upon two lions, the lawgivers Aristotle, Solon, Numa, and Moses, and an admirable group of the Emperor Trajan reining in his horse to listen to the widow's prayer for vengeance upon the murderer of her son.

### Sewer Construction.

SIR R. RAWLINSON, C.E.

A main point to be kept in mind by the engineer is that sewers and drains should not be continuous flues up which sewage gases can flow, accumulate, and concentrate, but all sewers and drains should have points of interception and of ventilation calculated to subdivide and liberate the fresh gases at numerous safe points, externally. That is, no sewer nor drain must, under any conditions, form one continuous tube or flue; neither should sewers nor drains traverse the basements of buildings, public or private, but be outside the main walls.

## NOTES AND COMMENTS.

MANY books have gained a name through printers' blunders, and if a volume is secure of renown in proportion to the number of its errors, the Salon catalogue need have little fear of rivals. The French are so orderly in works of the kind, we can only suppose that the Society of French Artists has been made the subject of a practical joke. In a great many cases numbers appear to be omitted; in others the figures have been transposed in a mysterious way, and, in consequence, do not correspond with those on the frames. But errors of the kind might be overlooked, for the visitor can identify the pictures if he has time to spare for mastering the puzzle. But what is to be said of the colossal blunder which gives the catalogue pre-eminence, and which we have now to describe? On page 228, after No. 2,579, we find 2,480, and the numbers follow in succession. On page 218—for ten is an important number in France—we find the same 2,480, and a corresponding regularity in succession. You hear that Mr. BASIL BRADLEY has one of his pictures in the Salon under the number 2,484, and you naturally look for a work by the first of living English animal-painters. But, owing to the freak of the French compositors, the visitor who trusts to his catalogue probably finds himself in front of a picture of *Judith and Holofernes* with the same number. Frenchmen make capital fun out of the odd titles which the pictures have acquired, and the English reader may gain a faint notion of the daily experience of the visitors to the Salon by using last year's catalogue for the present exhibition at the Royal Academy. To give piquancy to the joke, the publishers announce that they "poursuivront rigoureusement" every one who copies their catalogue.

OWING to the topsy-turvy style of printing, it is impossible to say how many works are really exhibited in the Salon this year. The highest number in the catalogue is 5,034, which comprises painting, sculpture, architecture, drawings, engravings and lithographs, medals, &c. The last picture among the paintings is numbered 2,488, and if the catalogue were correct it would show that this year's Salon corresponds with last year in the quantity of pictures. There are more lady artists represented than heretofore. In the section of painting they have 198 works, in sculpture 98 works, and one work among the medallions. Thirty-seven of the engravings are by female hands. The proportion among the water-colour drawings and designs is the highest of all, for there are 215 works by ladies, or more than one-fourth.

THE London Corporation have decided to adopt a report of the chairman of the City Lands Committee recommending that the old Bankruptcy Court, with the ground, shall be purchased at a cost of 93,500*l.*, the value determined upon between the City architect and Sir HENRY HUNT on behalf of the Government. The scheme for forming an open space in front of Guildhall, so as to show the whole façade and improve the general appearance of this locality, thus seems likely to assume larger proportions than was originally anticipated. The clearing away of the old law courts and the removal of the police-court opposite would alone be a desirable improvement.

ON Tuesday a fine bust of THOMAS GRAY was unveiled in the hall of Pembroke College, Cambridge, and now marks the spot whereabouts the poet so often sat, and where he was seized with his last illness. The features of the bust have been taken by Mr. HAMO THORNYCROFT from a picture and silhouettes and a small drawing belonging to the College. Sir FREDERICK LEIGHTON, who was present, humorously suggested that a certain Nemesis seemed to have decreed that a response should come not through the lips of one whose craft it is to gild his thoughts in words, but from one who seeks to be articulate in forms and colours, as public penance for certain cold discourtesy said to have been evinced towards GRAY by the painter HOGARTH. It is interesting to note the individuality of GRAY from the artist's point of view, as described by Sir FREDERICK LEIGHTON as follows:—"One finds something to forget, but how much to love and to admire. He was a

prophet and a precursor in all that we love and admire. It was chiefly in relation to landscape that the artist's feeling stirred in him. Nature knew him for her lover, and unsealed to him her inmost secrets. Her beauty revealed to him new and richer meanings. A fuller charm breathed for him out of the meadow and from the mountains lost in antique gloom, and let in a new day. That gloom was turned before his eyes to glory. The new dawn was at hand, and the path was clearing for TURNER, for CONSTABLE, for CROME. Thus it is due from the artist to join in doing homage to a man who was foremost among those to herald the day that gave such men to our country."

M. CARRIER BELLEUSE modelled the statue of ALEXANDRE DUMAS which was unveiled on Sunday at Villars Cotterets, the native village of the great romance writer. It has been a labour of love for the sculptor, in the same way as DORÉ's figure in the Place Malesherbes, which was produced without any thought of commission. DUMAS is represented standing in a sort of loose coat, with his shirt also open and his neck bare, as was his custom when at work. The left hand rests on a pedestal, inscribed with the names of the author's works. The endeavour of the artist was to suggest not only the man of genius, but the generous companion who fascinated everybody who met him, and who was as prodigal in his charity as in his invention of plots and incidents.

A SOCIETY is proposed to be formed in Glasgow under the title of the Regality Club, with a view of preserving a record of the relics of old Glasgow, or, at any rate, of such as still remain before they have all disappeared in the ravages of the City Improvement Trust. The membership of the Regality Club will be limited to two hundred, each of whom will pay an annual subscription of one guinea. In this way it is hoped a fund will be formed sufficient to enable the club to issue to the members photographs or other reproductions of whatever is thought worthy of having its memory preserved. To these reproductions a descriptive notice will be attached.

THE first mass will be said in the Catholic church of St. Piran, Chapel Hill, Truro, at 9 A.M. on the Feast of Corpus Christi, June 4, and during the day there will be exposition of the Blessed Sacrament from the morning to the evening service. Mr. SILVANUS TREVAIL, of Truro, is the architect. Remains of the original oratory of St. Piran still exist at Perranzabuloe, having been discovered early in this century, after being lost for over one thousand years under the shifting sands. St. PIRAN came over from Ireland, and, after his death, his remains were buried beneath the altar of his oratory.

THE collection of Orcadian antiquities formed by Mr. J. W. CURSITER, F.S.A.Scot., has received an addition in a curious relic discovered two or three feet below the peat moss on a farm in the neighbourhood of Kirkwall. This is a box cut out of a solid piece of beech, which measures 11½ inches in length by 5½ broad and 3 deep. The lid, sides, and one of the ends have been richly carved, each with a different pattern of scroll-work. The lid, the whole of which has not been secured, seems to have been a sliding one, being pushed in from the carved end of the box under a metal band, through grooves in the upper inside edge of the sides. When come upon, the box was standing on end upon the subsoil under the peat, and contained what has evidently been the tools of a wood-carver or similar tradesman, packed in a material too far decayed to be preserved, resembling fine straw, the handles of which alone remain to tell the tale. There are about fourteen of them, made of horn, bone, deers' horn, and wood, some of them evidently carrying a blade at each end. The box also contained two awls, one made from a tine of deers' horn, and the other of bone with a large rounded head, and a piece of pumice stone rubbed smooth on all sides. In the sides of the box are small holes, through which thongs of leather have been inserted and fixed inside by being tied, the other ends evidently intended for tying across the top of the lid. There were two or three small pieces of thin leather also found in the box.

## ILLUSTRATIONS.

ENTRANCE GABLE, ST. PETER'S HOSPITAL.

WE give this week a view of the central gable of this building, which was built about three years ago. The materials are red brick, with Portland stone for the doorway and the mullions of the bay window. All the rest of the moulded work in the cornices, pilasters, and carved panels is in cut and rubbed brick. The builders were Messrs. PATRICK & SON, and the architect Mr. J. M. BRYDON, of 5 Cambridge Place, Regent's Park, from whose drawing in the Royal Academy our lithograph is taken.

AN ARTIST'S COTTAGE.

THIS illustration is taken from a water-colour drawing by Mr. THOMAS WARD, architect, which was exhibited last year at the Royal Academy.

THE CANTERBURY PILGRIMS, BY T. STOTHARD.

THE plate from STOTHARD'S picture, which we published a few years since, was in a very short time "out of print." Since then we have had continued applications for a reprint, and they became more urgent on the appearance of the companion work, *The Flitch of Bacon*. We have been, in consequence, compelled to reproduce the *Canterbury Pilgrims*, and we cannot give a better description of the work than an article which was written to accompany the plate when it first appeared in *The Architect* :—

In the early part of the present century there was a man named CROMEK, who, in his own opinion, had a great influence on the art and literature of the time, and who used to boast of the painters and poets he discovered and helped to make famous. He was by trade an engraver, having been one of BARTOLOZZI'S apprentices, and some fairly good plates by him may be found in books. There was nothing remarkable about his work, and being a shrewd fellow he saw that he must take some other road to affluence. Accordingly he set up as a kind of medium between men of ability and the public, and was partly agent, partly publisher, and, if need be, a compiler of other people's writings. It was inevitable that such a man must soon know that in WILLIAM BLAKE there was an instrument likely to be of use to him in his projects. That fine poet, painter, designer, engraver, and mystic, after many vicissitudes, was then living in lodgings in South Molton Street. The mighty spirits who so commonly came to him in his visions did nothing for his worldly prosperity, and at that time he was so poor that, according to CROMEK, Mr. and Mrs. BLAKE were compelled to live on half a guinea a week. CROMEK had not much difficulty then in dealing with such a man. By holding out promises of profitable work in engraving, BLAKE undertook to prepare those noble designs for BLAIR'S "Grave," which are the most popular of his works, at the absurd rate of a guinea and a half apiece. In speaking of things he had in view, BLAKE once let CROMEK see a pencil sketch of a Procession of the Canterbury Pilgrims, and he gave a commission for a finished drawing, or at least beguiled BLAKE into thinking so. CROMEK, however, went to STOTHARD, with whom he had much business, and, with his usual volubility, suggested to him, as if from himself, how excellently the same subject could be treated. He pretended how often he had desired to see such a picture as the pilgrims travelling on their way. The subject was attractive to STOTHARD, who had a high opinion of his own powers to paint horses in action; besides, it was one well within his province as an illustrator of English literature. A bargain was easily made. STOTHARD was to have sixty guineas for a picture which might be engraved, besides indefinite profits contingent on the success of the speculation.

STOTHARD did his best to have his picture accurate. His sons knew something of archæology, and by them he had sketches taken of costume from old manuscripts, monuments, &c. The head of CHAUCER was taken from the portrait which is supposed to have been painted by OCCLEVE. The moment selected for the picture was at the time when the procession had passed beyond the boundaries of London, and it now sounds strange to hear it said that

the wooded background was actually sketched by STOTHARD from the Old Kent Road. Seldom has a painter derived so much sincere pleasure from his own work as STOTHARD did from his *Canterbury Pilgrims*. He used to tell people that he liked to stand near the Wife of Bath listening to her witty talk. "You will find me," he once said, "resting on the bridle of her steed." When the picture was complete, CROMEK exhibited it all over the country. It was received by the public with the applause to which so attractive a work was entitled, and what perhaps is more remarkable, other painters were loud in their praise of the picture. HOPPNER said there was only one drawback—it had not antiquity in its favour; while "in respect of the execution of the various parts of this pleasing design, it is not too much praise to say that it is wholly free from the vice which the painters term *manner*, and it has this peculiarity besides, which I do not remember to have seen in any picture, ancient or modern, that it bears no mark of the period in which it was painted, but might very well pass for the work of some able artist of the time of CHAUCER. This effect is not, I believe, the result of any association of ideas connected with the costume, but appears in a primitive simplicity and the total absence of all affectation either of colouring or pencilling." The characteristic merits of the picture were, however, more truly described by the late CHARLES R. LESLIE, and as coming from such a master of the humorous in painting, his words need no confirmation. Speaking of this picture, he says :—"His humour is as true and delicate as that of ADDISON. His illustrations of the 'Spectator' are therefore perfect; but the picture in which he has displayed the most of discrimination of character is his *Canterbury Pilgrims*. The personages of CHAUCER all seem to pass before our eyes as if they were shown to us by a painter contemporary with the fact." Besides utilising the picture for the engraving, and obtaining the profits of the exhibitions, CROMEK obtained for it the sum of 300*l*.

LOUIS SCHIAVONETTI was first selected as the engraver of the plate, on his death it was handed over to his brother, and finally it was finished by JAMES HEATH.

Meantime, what was WILLIAM BLAKE doing? When he saw STOTHARD at work he was too simple to believe that the picture was in any way related to his own design. But at last, on discovering CROMEK'S treachery, he resolved to paint the *Canterbury Pilgrims* in fresco, and to engrave a large plate after it. The engraving was to be 3 feet 1 inch by 12 inches high, and was to be finished in a year, for, said BLAKE, "No work of art can take longer than a year; it may be worked backwards and forwards without end, and last a man's whole life; but he will, at length, only be forced to bring it back to what it was, and it will be worse than it was at the end of the year." Even in those days there were people who admired BLAKE'S design. It was preferred to STOTHARD'S by CHARLES LAMB. He said it was "a work of wonderful power and spirit, hard and dry, yet with grace." But the pecuniary results were not gratifying. The fresco was exhibited by BLAKE in a room over his brother's shop, but nobody came to see it. BLAKE accused STOTHARD of abetting CROMEK in filching his idea of the picture, and the long friendship of the two artists was broken in consequence, but, at the time, men who were impartial considered there were no real grounds for the charge, and since then nothing has been discovered which in any way implicates STOTHARD. The two designs are the most interesting pictorial interpretations of CHAUCER which we possess, one of them, as Sir HENRY COLE used to say in the days when he was the genial "Felix Summerley," suggestive of RAPHAEL by its grace, the other of MICHEL ANGELO in its severity. Each is characteristic of the artist, and if one will continue to be the more popular, the other may be said to show the deepest insight into the characters created by CHAUCER.

The Prefect of the Seine, in asking for a further grant in favour of the municipal libraries which have of late been opened in Paris, states that a considerable addition has been made to them since his last report, for, whereas there were only twenty-four of them at the close of 1883, there are now forty-two, and this total will be raised to forty-six by the end of the year. His object is to have a library in each of the eighty "quarters" into which Paris is for municipal purposes divided; but this will not be effected for three or four years at the least.

## RESTORATION IN CORNWALL.

A REPORT has been prepared by Mr. J. D. Sedding on the condition of the well-known old church at Madron, near Penzance, and in the neighbourhood of which is the old ruined oratory, known as St. Madron's. Speaking of Madron Church, Mr. Sedding says the building ranks as the mother-church of Penzance, and its architecture represents, by some detail or other, almost every period of English art. Its walls date from Norman times. The antiquity of the church was previously well known by the fact of its having a Norman font, but its age is established by still further proofs. The present fourteenth century south arcade stands upon the foundations of a church of much earlier date; the eastern respond has the original circular Norman pier; and the eastern and western responds have the original Norman walls, 3 feet 3 inches thick. The range of its architectural types gives the church singular importance, for there is an Early English sedile and credence in the chancel, a two-light thirteenth-century window, the tower and south arcade date about 1350, the north arcade is of two periods of the 15th century (the eastern half—of Bere stone—is of Devonshire type of mouldings and carvings, and was probably brought to Penzance by boat, while the western half is of local type), and the windows, roofs, and screens are of several periods of later Mediaeval work. Further, there are some exceptionally fine monumental slabs of early seventeenth century date, with hatchments, monuments, pulpit, and other fittings of still later date. The church is thoroughly representative, each and all of the relics of the past enumerated are either typical of English art of various periods or bear upon local history. The restoration, if undertaken, should be carried out without any unnecessary disturbance of time-honoured features, and without tampering with any detail in the church which has local or artistic value.

In reference to the condition of the fabric, the walls generally are in a good state. The three eastern bays of the south arcade need to be rebuilt and renovated, as the wall has gone at that part, the arches are pushed out eastward, and one of the piers and arches is considerably splintered by unequal pressure. Most of the windows require to have new tracery, as they have been sadly marred by various "restorations" by local workmen. The two eastern windows of the north and south aisles are modern, but were redone some few years ago in exceptionally good manner, and now only require new sills and other repairs. The stained glass now in the mason's Bath stone windows can be quite well adapted to suit properly-designed tracery constructed upon the old lines. In repairing the south chancel Mr. Sedding proposes to extend the chancel another 6 feet. As this extension would still leave a clear space of 9 feet to the boundary wall, and as any grave eastwards of this extended wall would not be interfered with, but included in the church, he would strongly recommend that this improvement should be carried out. He proposes to restore the south porch upon the old lines and in granite, and to refix the sun-dial. The north porch is built without foundations, and has slipped bodily away from the church, showing a fracture in the roofs and slating at the junction with the aisle wall. The slating throughout is very old and bad, and must be new. The south wall of the south aisle is out of the perpendicular and requires repair. At the same time that these repairs are done the old rood-loft staircase, which has been destroyed, should be restored, and the old door, which is in existence, reopened on the inside of the church. The modern plastering of the walls needs to be re-done. The upper windows of the belfry are defective, and need new tracery. Three pinnacles of the tower will have to be taken down and reset with proper dowels. The tower parapet needs repair; it should be taken down on the east side and repaired where defective. The whole of the roofs are of fifteenth-century date, and capable of repair. Considering the exposed situation of the church, it will be advisable to point the slates with oil putty. The present seating is very unsatisfactory, as it is both inconvenient and unsightly, and the new seats would be of the fifteenth century Cornish type. The old screens would assist him in designing the new seats. He would propose to have the seat ends carved in oak similar to the best types in the locality. According to the new plans the seats would accommodate 475 persons. The carved screens found concealed under the baize and framework of the modern pews are of very fine design; these would naturally be restored in accordance with the fragments found. The screen to the south chancel aisle is of unusually rich character, and the treatment of the lower panels is unique. The old pulpit and sounding-board would be retained. The altar rails of about the same date would be re-used. The old hatchments would require to be taken down during the restoration of the roofs, but great care would be taken of them, and they would be replaced exactly in their present positions. The Norman font requires one new shaft, but it should be left in its present position, the place it has occupied for some hundreds of years. None of the ornamental slabs or monuments affixed to

the walls need be disturbed, but they must be carefully protected during the proposed works. The beautiful German sixteenth-century glass placed by the late vicar in the west window of the north aisle is worthy of better window tracery and of a more conspicuous place. Mr. Sedding proposes to put the organ in the north chancel aisle, and in front of this to place seats for women singers. The vestries would be at the extreme east end of this aisle, and entered from the old north door, and he proposes to place the heating-chamber underneath the vestries.

The cost of the whole of the works referred to in the report would amount to 3,000*l.*

## HARESCOMBE.

AT the excursion of the Gloucester Archæological Society last week, a long historical paper on Harescombe was read by the Rev. J. Melland Hall, in the course of which he described the church. Harescombe is five miles south of Gloucester, and contains only 478 acres. The church, which is situated at the southern extremity of the parish, is at the foot of the well-known range of hills called the Haresfield Beacon, Broadbarrow Green, &c., the site of ancient British and Roman encampments, a part of a chain of fortresses said to have been erected by Ostorius Scapula betwixt Severn and Avon, old British works adapted by the Romans to their own requirements. The church is dedicated to St. John the Baptist, and is of the simplest type, its chief feature of interest being the belfry-turret, which stands over the chancel arch, and is an octagonal spire of singular construction. Before the restoration of the church in 1871, the whole structure of the spire had subsided on its southern side, and was out of the perpendicular. It was therefore carefully taken down, the old stones being religiously preserved, and no new ones set up except where they were absolutely necessary. A perfectly plain cross, an exact *fac simile* of the original, crowns the whole. The four pinnacles now appear with a moulding and crosses of iron. Previously they were truncated and ended abruptly, and it is probable that they were anciently surmounted by statues of the Four Evangelists. At the time of the restoration of Harescombe Church, it is said that a dedication cross was found painted on the north wall. This was unfortunately destroyed by the workmen during the absence of the architect; but Mr. Hall thought that the remains of another of the consecration crosses could be just discerned over the south door. There were two bells in the bell-cot. That in the southern compartment might be supposed to be the original bell of the chapel of the Lord of Alan and his son Roger, if not of still earlier date. As was usually the case with the most ancient bells, it has no inscription; it is of singular shape, long and tapering like the flower of the campanula. The one in the northern compartment was somewhat smaller, and of later date. It bore an inscription in Lombardic capitals, "In Honore Beate Marie Virginis." As it had been useless for many years, a large piece out of the sound-bow being broken, it was recast by Messrs. Taylor, of Loughborough, and was used for the first time on Sexagesima Sunday, 1884. The ancient inscription is reproduced on it. The font is of the Early English period, and is of large dimensions; a massive circular bowl, supported on clustered pillars, thirteen in number. There is a moulding immediately below and above the pillars. So far it is one block of Minchinhampton stone. This was doubtless the font of the Chapel of Alan.

## THE EDINBURGH MUSEUM.

BY means of a syndicate formed of a number of noblemen and gentlemen, eighteen choice pieces were secured for the public museums of the country from the Fountaine Collection sold last year, and the *Scotsman* notices that four of these have been obtained for the Edinburgh Museum, where they are now on view. They include an example of each of the three kinds of ware named—Limoges enamel, Palissy ware, and Italian majolica. The specimens are:—A Limoges enamel dish, 17 inches diameter, by Penicaud (the third of that name), with the *Supper of the Gods*, after Raphael, 766*l.*; a Palissy ewer, 12 inches high, 309*l.*; a Palissy dish, with the *Rape of the Sabines*, 18 inches long, 84*l.*; and a water-jug of Urbino majolica, 10 inches high, with arabesques, 80*l.* The first two are figured in the illustrated catalogue of the sale.

The productions of Palissy have been of late years so cleverly imitated that it has become very difficult to tell a genuine from a spurious piece. It was a common remark at the time of the sale that, if they could be ascertained, the prices paid by Sir A. Fountaine at the beginning of last century for a number of his superb pieces would no doubt form a remarkable contrast to those realised for them at the present time. Still more curious, however, would it be

to learn what Palissy, who spent many years of his life in extreme poverty, obtained himself for good pieces of his ware—for example, for this small jug, bought for the Edinburgh collection, and which now fetches nearly three times its weight in gold. Palissy decorated his earthenware in three ways—with figure subjects, with conventional ornament, and with realistic models of plants and animals, and at one time of his life burned, in default of other fuel, his household furniture to feed his furnace at Saintes. The last, called his “rustic pieces,” are the most popular, but are not those on which his fame as an artist rests. The little water jug above referred to, and some much more expensive pieces which were in the Fontaine collection, are covered with this “rustic” decoration of natural leaves and shells—a style of ornament which is universally condemned as inartistic, at least when applied to objects of utility, or even when employed for purely decorative purposes. Notwithstanding this, judges of mediæval and later art so accomplished as Mr. Robinson and Mr. Franks (the advisers of the syndicate), paid at the sale far larger sums for this kind of Palissy ware than for equally important pieces of the more truly beautiful specimens of his handiwork. The explanation perhaps is that these are the most characteristic, or at least the most easily recognised, productions of “the artist in earth.”

The Limoges painted enamel is a beautiful specimen of this peculiar art. As already stated, the subject is Raphael's *Supper of the Gods*. The figures are painted in black and white, with a tinge of red on the flesh portions, and lines of gold on the drapery. The execution is bold and spirited, but at the same time careful, and belongs to a time—the sixteenth century—when the enamellers of what has been called the Mediæval Birmingham had risen to the rank of able artists, working by means of a difficult technical process. There is a great contrast between the style of art on this dish and that on the Champlévé enamel shrine obtained for the museum at the Castellani sale last year, and made at Limoges more than two hundred years earlier.

Mr. Calder Marshall, R.A., has recently presented to the museum two very beautiful and interesting life-sized models executed by himself. One of them, called *The Young Briton*, represents a mother investing her son with his father's torque, and reciting to him his father's warlike deeds, in the hope that he too will “Be a hero in the strife.” The other model is *The Prehistoric Artist* drawing the mammoth on a mammoth's tusk.

“Antiquity after a time has the grace of novelty.”—HAZLITT.

### ADDISON IN ITALY.

(Concluded from page 313.)

TRAVELLING in Italy in those days was a slow proceeding, and six days were occupied on the road between Loretto and Rome. It is remarkable that Addison used Rome merely as a place of stoppage on his way to Naples, although he arrived in time to witness the magnificent ceremonies of Holy Week. He hurried to St. Peter's and the Pantheon, and drew the following comparison between them:—

“Upon my arrival at Rome I took a view of St. Peter's and the Rotunda, leaving the rest until my return from Naples, when I should have time and leisure enough to consider what I saw. St. Peter's seldom answers expectation at first entering it, but enlarges itself on all sides insensibly, and mends upon the eye every moment. The proportions are so very well observed, that nothing appears to an advantage, or distinguishes itself above the rest. It seems neither extremely high, nor long, nor broad, because it is all of them in a just equality. As on the contrary in our Gothic cathedrals, the narrowness of the arch makes it rise in height, or run out in length; the lowness often opens it in breadth, or the defectiveness of some other particular makes any single part appear in great perfection. Though everything in this church is admirable, the most astonishing part of it is the cupola. Upon my going to the top of it, I was surprised to find that the dome, which we see in the church, is not the same that one looks upon without doors, the last of them being a kind of case to the other, and the stairs lying betwixt them both, by which one ascends into the ball. Had there been only the outward dome it would not have shown itself to an advantage to those that are in the church; or had there only been the inward one it would scarce have been seen by those that are without; had they both been one solid dome of so great a thickness the pillars would have been too weak to have supported it. After having surveyed this dome I went to see the Rotunda, which is generally said to have been the

model of it. This church is at present so much changed from the ancient Pantheon, as Pliny has described it, that some have been inclined to think it is not the same temple; but the Cavalier Fontana has abundantly satisfied the world in this particular, and shown how the ancient figure and ornaments of the Pantheon have been changed into what they are at present. This author, who is now esteemed the best of the Roman architects, has lately written a treatise on Vespasian's amphitheatre, which is not yet printed.

“After having seen these two masterpieces of modern and ancient architecture, I have often considered with myself whether the ordinary figure of the heathen or that of the Christian temples be the most beautiful, and the most capable of magnificence, and cannot forbear thinking the cross figure more proper for such spacious buildings than the rotund. I must confess the eye is much better filled at first entering the rotund, and takes in the whole beauty and magnificence of the temple at one view. But such as are built in the form of a cross give us a greater variety of noble prospects. Nor is it easy to conceive a more glorious show in architecture than what a man meets with in St. Peter's when he stands under the dome. If he looks upward, he is astonished at the spacious hollow of the cupola, and has a vault on every side of him, that makes one of the most beautiful vistas that the eye can possibly pass through. I know that such as are professed admirers of the ancients will find abundance of chimerical beauties the architects themselves never thought of; as one of the most famous of the modern in that art tells us the hole in the roof of the Rotunda is so admirably contrived that it makes those who are in the temple look like angels, by diffusing the light equally on all sides of them.”

Addison does not say much about Naples. “I shall not be particular,” he writes, “in describing the grandeur of the city, the beauty of its pavement, the regularity of its buildings, the magnificence of its churches and convents, the multitude of its inhabitants, or the delightfulness of its situation.” Very few pictures and statues were to be seen, for the viceroys had removed all that were valuable to Spain. Addison spent some time in exploring all the places of interest to a Latin scholar, but Pompeii and Herculaneum were then concealed from the traveller's gaze. He returned to Rome by sea. “As in my journey from Rome to Naples,” he wrote, “I had Horace for my guide, so I had the pleasure of seeing my voyage from Naples to Rome described by Virgil.” On his second visit to Rome he occupied himself with sculpture, considering mainly to what extent the statues served as illustrations of literature. He was struck with the columns of rare marbles from ancient buildings which are to be found in the churches. He gives the following explanations of the variety of character that is to be seen in them:—

“As for the workmanship of the old Roman pillars, Monsieur Desgodetz, in his accurate measures of these ruins, has observed that the ancients have not kept to the nicety of proportion and the rules of art so much as the moderns in this particular. Some, to excuse this defect, lay the blame of it on the workmen of Egypt and of other nations, who sent most of the ancient pillars ready shaped to Rome. Others say that the ancients, knowing architecture was chiefly designed to please the eye, only took care to avoid such disproportions as were gross enough to be observed by the sight, without minding whether or no they approached to a mathematical exactness. Others will have it rather to be an effect of art, and of what the Italians call the *gusto grande*, than of any negligence in the architect; for they say the ancients always considered the situation of a building, whether it were high or low, in an open square or in a narrow street, and more or less deviated from their rules of art to comply with the several distances and elevations from which their works were to be regarded. It is said there is an Ionic pillar in the Santa Maria Transtevere, where the marks of the compass are still to be seen on the volute, and that Palladio learnt from hence the working of that difficult problem; but I never could find time to examine all the old columns of that church.”

The next goal of Addison was Florence, and it was reached by the long road through Siena, Leghorn, and Pisa. In spite of his predilection for Classic work the Cathedral of Siena wrung admiration from him:—

“There is nothing in this city so extraordinary as the cathedral, which a man may view with pleasure after he has seen St. Peter's, though it is quite of another make, and can only be looked upon as one of the masterpieces of Gothic architecture. When a man sees the prodigious pains and expense that our forefathers have been at in these barbarous buildings, one cannot but fancy to himself what miracles of architecture they would have left us had they only been instructed in the right way; for when the devotion of those ages was much warmer than it is at present, and the riches of the people much more at the disposal of the priests, there was so much money consumed on these Gothic cathedrals as would have finished a greater variety of noble buildings than have been raised either before or since that time.

"One would wonder to see the vast labour that has been laid out on this single cathedral. The very spouts are loaded with ornaments; the windows are formed like so many scenes of perspective, with a multitude of little pillars retiring one behind another; the great columns are finely engraven with fruits and foliage that run twisting about them from the very top to the bottom. The whole body of the church is checkered with different lays of white and black marble, the pavement curiously cut out in designs and scripture-stories, and the front covered with such a variety of figures, and overrun with so many little mazes and labyrinths of sculpture, that nothing in the world can make a prettier show to those who prefer false beauties and affected ornaments to a noble and majestic simplicity."

Sculpture rather than architecture attracted Addison in Florence. "There are some beautiful palaces in Florence," he writes, "and as Tuscan pillars and rustic work owe their original to this country, the architects always take care to give them a place in the great edifices that are raised in Tuscany. The duke's new palace is a very noble pile, built after this manner, which makes it look extremely solid and majestic. It is not unlike that of the Luxembourg at Paris, which was built by Mary of Medicis, and for that reason perhaps the workmen fell into the Tuscan humour." For modern statues he gave the preference to Florence over Rome. After visiting Bologna and Turin, Addison turned his face homewards, and, crossing Mont Cenis, arrived in Switzerland. Later in life he was supposed to set little value on foreign travel, unless as the best means of demonstrating the superiority of English institutions. But when Addison wrote his first book he was less a politician than a scholar, and he was not afraid to say, "There is certainly no place in the world where a man may travel with greater pleasure and advantage than in Italy. One finds something more particular in the face of the country, and more astonishing in the works of nature, than can be met with in any other part of Europe. It is the great school of music and painting, and contains in it all the noblest productions of statuary and architecture, both ancient and modern."

### COVENTRY CHURCH TOWER.

AT the meeting of the general committee for the restoration of St. Michael's church and steeple, Coventry, a letter was read on the state of the tower and steeple, in which the late Sir Gilbert Scott said:—

My attention having been recently directed to the state of the interior of the tower of St. Michael's church, I beg to trouble you with a few remarks and suggestions as to that beautiful portion of the building, which I have been surprised to find is even in Coventry much less known than it deserves.

The whole interior of that magnificent tower was originally open to the church, and visible from within to the height of about 100 feet from the pavement. The walls are throughout ornamented with niche-work, and the windows are as richly moulded within as without, while the whole was closed in overhead with a beautiful groined vaulting of stone, thus forming altogether a most magnificent lantern, probably nearly (or quite) the finest in England.

When this was first shut off from view I am not aware, but it would appear that about fifty or sixty years back the bells, which were formerly above the lantern, were lowered into it, the groined vaulting was destroyed to make room for them, and the entire lantern was choked up from bottom to top with a huge structure of timber-work to carry the bells, which, after all, do not appear to be much aided by this enormous sub-structure, but still rest in great measure, if not entirely, upon the walls, the finest feature in the interior of the church being thus destroyed for no practical utility. I am inclined, indeed, to think that the tower would be much more secure without this encumbrance.

As so much is now being effected to bring back the interior of the church to its ancient beauty, I would beg earnestly to press this feature on the attention of the parishioners.

It would be a magnificent addition to what is already doing if this beautiful feature were again brought into view by clearing it of its obstructions.

There are two ways of effecting this—the one is to restore the bells to their proper place, one storey higher than at present, supporting them by a very strongly framed floor, so constructed as to brace the tower immovably together at that level, and thoroughly doing away with the present timber-work, and restoring the internal features of the tower.

The one drawback to this is the dilapidated condition of the tower itself. Had there been any prospect of the immediate and thorough restoration of the tower, an object most earnestly to be wished for, I should have no hesitation in urging this most natural course; if, however, the tower is externally still to be left in its mouldering condition, if its once glorious symmetry is still to be lost in ruinous decay, and its once powerful and

nicely graduated buttresses be suffered still from year to year to fall away into impalpable dust, and to become mixed with the soil of the churchyard below, I would not venture upon such a suggestion. There can be no doubt that every vibration of the bells causes some portion of the moulded surface to be lost, and till that surface can be effectually restored the bells will be better elsewhere.

I made about seventeen years since a very careful survey, with measured drawings, of the tower, and I can speak from my own observation in saying that the disintegration of the exterior has, during that interval, made rapid progress—a process mutually aided by the action of the atmosphere from without and the vibration of the bells from within, every particle weakened by the one being soon shaken off by the other.

Unless, therefore, there could be a public movement for the restoration of the beautiful steeple throughout, I would strongly recommend that one of the causes of disintegration should be removed, and that the present timber construction should be temporarily erected at the bottom of the churchyard for the reception of the bells till the tower be restored. This will have the double effect of saving the crumbling exterior from injurious vibration, and of opening out the beautiful interior to view. The timber framing is extremely massive and strongly braced, and could, with some additions, be rendered a strong and serviceable campanile which a little contrivance would render not unsightly. I, of course, view it only as a temporary structure, feeling well assured that the feeling of the county and of the country generally will not permit one of the finest steeples we can boast to continue in decay, and that before many years we might thus be able safely to restore the bells to their original position.

A meeting will be held to decide on the sections of the work to be carried out, the tender for which we publish this week.

### ASHLEWORTH.

AN excursion was made on Wednesday in last week by the Bristol and Gloucestershire Archæological Society to Wainlode Hill and Ashleworth. In course of the proceedings, a paper was read by Mr. F. W. Waller on a group of buildings of much archæological interest at Ashleworth. These were the parish church, the courthouse, the barn, all near together and forming a picturesque group, and the old vicarage, slightly removed from the church. The date of the buildings, Mr. Waller said, was conjectural. The church, like most other parish churches, has a history commencing with the Conquest, or perhaps even in earlier times, from whence in the different parts of the building we can trace all styles of English church architecture—namely, Norman, Early English, Decorated, and Perpendicular, and ending, so far as we have any interest in following it, in the Jacobean pulpit and other fittings. The church consists of a nave, 45 feet by 17 feet; a chancel, 21 feet by 14 feet; a south aisle, 44 feet by 13 feet; and a chancel aisle, 24 feet by 13 feet, and a north porch and a tower at the west end of the nave. There is an arcade of four arches between the nave and south aisle, a chancel arch, and an arch between the chancel and the chancel aisle. Part of the steps to the rood loft yet remain; some portion of a good oak screen, a fine Perpendicular font, and two piscinas. The north wall of the nave, 2 feet 7 inches in thickness, is without doubt the oldest part of the building, and in the interior it presents one of the most interesting specimens of herring-bone masonry in this county. This may be Saxon, or it may be Norman work, for it is difficult to understand what alterations have been made in this portion of the original structure. The introduction of the Late Perpendicular doorway is simple enough; but what is the small doorway now converted into a window? Is the semi-circular arch over the interior of the doorway a Norman insertion in Saxon work, or is it altogether Norman? The door itself, with its old wood lock and ironwork, appears to be of Norman times. Buff stone was used for the dressings of this work, and the same material can be seen over the nave arcade—probably the old stone of the Norman walls re-used by the builders of later periods. Next in antiquity is the chancel of Early English work, the north and east walls of which are 3 feet thick, and there are two windows in the north wall, one a triplet, and the other a single light. The east window has been filled in with modern tracery. We then come to the lower stages of the tower and part of the chancel aisle, in which we have Early Decorated architecture of a fine order, especially the two-light west window of the tower and a small priest's doorway in the south wall of the chancel aisle, which is very simple and effective. The roofs of the church, partly Early English and partly Decorated, are of rude construction. Each rafter is framed and trussed, and with tie-beams extending from wall to wall. A part of the south aisle roof is boarded and divided into panels. The arcade between the nave and the south aisle consists of four arches, carried on piers 2 feet 2 inches in diameter. The

arches are four-centred, and the mouldings of the capitals, and indeed the whole of the stonework of this arcade, is of a very rough kind of chopped work. In the outer members of the arches the re-use of the puff stone may be noticed. The builder of the courthouse adjoining the church has left his mark on the east window of the south aisle, now filled with modern tracery. The label moulding is of the same section, and terminated in the same manner as the courthouse windows. This is especially to be noticed in the large relieving arch. The south porch and the upper part of the tower and spire are Late Perpendicular. There are remains of good oak seating and an old oak screen in the south aisle, and an old door with good ironwork at the west end of the south aisle, all of which are well worth inspection. A wooden porch was removed some years ago from the west end of the south aisle. There are six bells in the tower, cast by Rudhall. One is dated 1687, by Abraham Rudhall, which Mr. Ellacome says is probably one of his earliest bells. The base of the old churchyard cross yet remains on the south side of the church.

In the courthouse we have the remains of a fine and strongly-constructed manor house, probably of the fifteenth century. It has been altered considerably since its erection, but the original building can be easily traced. Partitions of all kinds have of late years been erected across the various rooms to convert the building for the purposes of a farmhouse, as which it is now used. There is a large hall (now divided into several rooms on the ground and first floors), the original dimensions of which were 37 feet by 19 feet and 20 feet high to the wall plates, having a fine open oak roof. It is lighted in the east and west walls by means of four large transomed windows, two in each wall. Here also are the chief entrances to the house. There are two similar but smaller doorways in the south wall leading into a part of the building which probably contained the kitchen, butteries, &c. On the other side of the hall, and extending further towards the east, are large rooms, probably parlours and private rooms, and above these are more rooms of the same size as those below, and open to the roof, approached by means of a circular stone staircase. The rooms over the kitchen are of a similar character, and one of these has been much altered since it was first erected; remains of stencilled decoration and inscriptions are to be seen on these walls. The whole of the building, including the hall, is covered with a fine oak roof, with well-framed principals about 9 feet apart, with collar beams, wind braces, &c., the effect of which is exceedingly good. The timber and stonework of this building are singularly massive; the floors are constructed with oak beams 1½ feet square, and about 8 feet from centre to centre, which carry joists 9 feet by 6 feet placed flat, and these joists are only 7 inches apart. The stonework is equally strong. Over the front doorway of the hall, which is 4 feet wide, there is first an arch of dressed stonework 1 foot 2 inches in depth, then a label moulding of 5 inches, and over all this a reclining arch turned in native stone 1 foot 3 inches in thickness. The arches over the windows are equally strong, as also the mullions of the windows, all of which are made to receive shutters. Note also the ceiling of the stone staircase with the heads in the cornice, one of a king (one of the Henrys) and the pretty quatrefoil windows in the east and south walls of the building. A lean-to building formerly existed against the east wall of the house, as may be seen by the string course and corbels still remaining, and foundations of other edifices have been discovered when digging for drains, &c.

The great tithe-barn, which is still in good preservation, and is in common use, is a large and picturesque building, 123 feet in length by 25 feet wide. It was erected about the same period as the courthouse. It is built of the native blue clay stone with freestone dressings. The roof, which is of oak, has been much altered and modernised. There are two porches, over the doorways of which are oak lintels instead of stone arches. Parts of the old doors yet remain. As a specimen of ancient wood construction there are few in the county to equal the old vicarage building. We now see it as a perfectly symmetrical house, with two wings and a central porch facing towards the west, but one of these wings, that on the north side, was erected about fifty years ago, having been very fairly copied from the old work of the south wing. The original building consists of a very fine entrance-porch, a good hall with kitchen and offices on the ground-floor, with bedrooms over each of these. The framing and decoration of the woodwork of this house are singularly fine and interesting, any written description of which would be of little use; measured drawings and sketches are quite requisite in order to properly explain the character of the work. The porch, with its grand old door and wicket and ceiling, the strong-framed ceiling of the hall and other rooms, and the various and bold enrichments, are all well worthy of careful study.

**Public Baths and Washhouses**, erected by Messrs. Hammond & Co., contractors, from the designs of Mr. Freeman, of Dublin, were opened in Tara Street, Dublin, on Monday.

## NOTES ON NOVELTIES.

### Hayward Tyler & Co.'s New "Extra Quality" Valve-Closets.

MESSRS. HAYWARD TYLER & CO., of 84 & 85 Whitecross Street, London, E.C., have lately brought out a new type of valve-closets which appear to be the best that are yet in the market. The fittings are of unusual strength and finish, being made in many cases of gun-metal in place of brass, with every improvement that long experience could suggest. The overflow pipe enters the box behind the valve, so as to avoid the chance of soil washing up into it when the valve is opened. The trap of the overflow is kept charged by a pipe from the main supply each time the closet is used. The dish and handle are of earthenware, and of large size. One important feature in these closets is the great attention that has been given to

insuring the best possible form of basin for perfect flushing, and to the decoration of the basin, dish, and handle, which are all made of best earthenware, and are all printed alike, so as to give a remarkably handsome effect when the closet is fixed. The patterns for this decoration are very carefully chosen, and show real taste applied to this necessary adjunct to our modern houses. These closets are well worthy the careful attention of architects and of such builders and plumbers as aim at procuring the best articles that can be procured. We may add that the prices appear very moderate, varying somewhat according to the pattern of the decoration. Architects wishing to have these closets used in their buildings should specify them as "Hayward Tyler & Co.'s extra quality valve-closets, with decorated basins and dishes."

Messrs. Hayward Tyler & Co. have also brought under our notice another novelty in "Campion's Water-waste Preventer," the action of which will be seen from the accompanying diagram. The following advantages will be found a great recommendation for its use, viz., that they can be readily

adapted to any existing closet, being easily fixed at a small cost; that they are out of sight, noiseless and certain in action, and have been passed by the New River Company; that no contamination of water in the cistern is possible, although the communication with the closet is direct; and that, whether viewed from the standpoint of economy, efficiency, or durability, they alike commend themselves to the attention of architects, builders, and plumbers.

**The Holloway Sanatorium**, Virginia Water, will be opened formally on June 15.

## CHURCH BUILDING AND RESTORATION.

**Coddenham.**—A committee has been formed to collect subscriptions and receive plans, specifications, &c., for work to be carried out under Mr. E. F. Bisshopp, diocesan surveyor, at the church of Coddenham. In his report, speaking of the roof, Mr. Bisshopp says an examination of the interior shows very serious separation of the whole of the timbers. The hammer beams have sagged to such an extent that the greater part of the tenons are drawn out of the braces and wall pieces, and the pins are snapped, and most of the timbers are kept together by wrought-iron straps. A deal collar-beam at the level of the upper hammer-beam has been introduced, and on examination of the exterior showed the reason for its introduction, viz., to prevent the total collapse of the roof owing to the dangerously slight bearing on the walls and the hammer-beams, and consequent serious condition of the timbers. Indeed, the hammer-beams can now be scarcely said to bear on the walls at all, except on the inner edges, and as the ends are seriously decayed their security becomes yearly less. There is a wall-plate on the south side 6 inches square, but it is about half rotten, and is not attached to the rest of the timbers, except to the common rafters. A similar wall plate originally existed on the north side, but this has entirely disappeared, leaving merely a heap of dust in its place. Consequently here the feet of the common rafters have no bearing, being morticed into the lower purlins; it would be quite possible for portions of the rest to give way bodily on any extra weight being applied. The cornice is rotten in places, particularly at the ends, where it is fixed into the principals, and I noticed one length which was held up by nails driven into the sides of the principals. The bosses at the feet of the well-pieces are insecure; the timbers themselves, except those as named above, are not seriously decayed, and the lead-work is in a very fair state, though becoming thin in places. I am of opinion the wood is chestnut. The parapets, both north and south, are in a very weak and decayed condition, and on the south side particularly the water has access to the interior of the walls. I am of opinion the condition of the roof is very serious, if not absolutely dangerous, and no time should be lost in its thorough restoration.

**Edale.**—The foundation-stone of the new Church of Holy Trinity, Edale, near Chapel-en-le-Frith, has been laid at Grinsbrook. Mr. W. Dawes, of Manchester, is the architect, and Mr. T. Beck, of Matlock Bridge, the builder. The church will accommodate two hundred persons. The estimated cost, with tower, spire, boundary walls, &c., is 2,557*l*.

**Farnworth.**—Excavations have been commenced for laying the foundations of a new church proposed to be built off Longcauseway, Farnworth, to be dedicated to St. Peter. The new church will be from designs by Mr. R. K. Freeman, F.R.I.B.A., of Bolton. Messrs. Coope Bros. are the contractors.

**Harrington.**—A Wesleyan chapel has been opened. Mr. W. G. Scott, of Workington, was the architect, and the contractors were:—Mason work, Mr. L. Ferguson, Workington; joiner work, Mr. John Simon, Harrington; slating, Mr. T. Mandale, Maryport; plastering, Mr. Thomas Black, Harrington; plumbing and gas-fitting, Mr. D. M. Walker, Workington; painting and glazing, Mr. Joseph Pratt, Harrington; ironwork, Mr. J. Milburn, Workington.

**Smethwick.**—The memorial-stones of a Methodist chapel have been laid. The building is to seat 590 persons. The cost is estimated at 1,400*l*. The architect is Mr. J. H. Burton, of Ashton-under-Lyne, and the builders are Messrs. H. Dorset & Son, Cradley Heath.

**Wolverhampton.**—St. Paul's Church has been reopened after improvement. The work has been done by Mr. Cockerill, under the direction of the architect, Mr. Veall, of Wolverhampton.

## SCHOOL BUILDINGS.

**Birstal.**—A large Wesleyan Sunday-school is to be erected at Birstal from the designs and plans of Mr. Walter Hanstock, A.R.I.B.A., of Batley. Contracts for the work have been accepted, amounting to about 2,800*l*. The school will contain no less than twenty-seven classrooms of various sizes.

**Carlisle.**—The memorial-stones of a Wesleyan Sunday-school and lecture-hall have been laid. The architect is Mr. J. Taylor Scott, of Carlisle. Preparations have been made for ventilation by Sheringham's inlet valves and Boyle's patent exhaust ventilators. The contractors are Mr. Gilbert Hill, builder, and Mr. James Hewitt, joiner; and the sub-contractors—Mr. Muncaster, plumber; Mr. Ferguson, plasterer; Mr. C. J. Nanson, slater; and Mr. Denard, painter and glazier.

**Huddersfield.**—The memorial-stone of a new junior mixed department to the Mount Pleasant Schools, Huddersfield, has been laid by Mr. J. E. Williams, J.P., chairman of the Works and Finance Committee of the Huddersfield School Board.

The original school was erected about ten years since. The new department will accommodate 460 children of both sexes in the first and second standards. There is also a room for teaching cookery to fifty of the elder girls. In the new department are included extensive covered playgrounds, and also covered playsheds for the infants' department, and sundry alterations to improve the old buildings. Contracts have been entered into to the amount of 5,411*l*. The style of the building is Early Gothic. The architects are Messrs. Henman & Harrison, of 64 Cannon Street, London, E.C.

**Ripponden.**—The memorial-stones of a Wesleyan Sunday and day school have been laid at Stones, Ripponden. The school is being erected from the designs of Mr. J. Crawshaw, architect, of Ripponden.

**Walthamstow.**—The foundation-stone of St. Michael and All Angels Sunday-school has been laid. The building is from the designs of Mr. J. M. Bignall, architect, of Clapham, the builder being Mr. J. S. Scott, of London Wall, E.C., and Walthamstow.

**Woodford (Essex) School Board.**—This Board having decided to enlarge their Churchfield schools, consulted Mr. Edward Tidman, C.E. (who has, as surveyor to the London and Suburban Sanitary Survey Association, just carried out a new system of ventilation and sanitation at these schools), and instructed him to prepare plans of a new infant school to accommodate 200 children. These plans were examined by the Board at their meeting on Friday last and approved, the architect being instructed to obtain the approval of the Educational Department, and to obtain tenders for the work to be submitted to a future meeting of the Board.

## GENERAL.

**An Art Treasures Exhibition**, similar to that held in Manchester in 1857, and subsequently at Leeds, Dublin, and Wrexham, is proposed to be held next year at Folkestone.

**M. Bonnat** has taken a sketch, and **M. Dalou** a cast, of the features of the deceased Victor Hugo.

**A Local Art and Industrial Exhibition** is proposed to be held at Lambeth, in aid of the fund for enlarging the parochial schools in two of the riverside parishes. The School of Art will be well represented.

**Oldwinstford Church, Stourbridge**, is to be renovated and repaired under the direction of Mr. Robinson, architect.

**Mr. Henry Patja** will read a paper at the meeting of the Society of Engineers on Monday on "Portland Cement."

**Some Antique Objects**, consisting mainly of fragments of Greek fictile art and statuettes, discovered by Mr. Petrie in his excavations at Naukratis, Lower Egypt, have just been unpacked at the British Museum.

**A Bridge** erected in place of the old wooden structure over the river Echaig (head of Holy Loch), Dunoon, from designs by Messrs. Bell & Miller, C.E., has just been opened. Messrs. Hanna, Donald & Wilson, Paisley, were the contractors.

**The Staffordshire Field Club** have paid a visit to Stoke-upon-Trent, and inspected the various pottery works.

**The Mayor of Lincoln**, Mr. J. Clarke, has announced his intention of building St. Hugh's Catholic Church and Presbytery in Silver Street, Lincoln. It is understood that the cost will be about 14,000*l*. Mr. Albert Vicars, of 151 Strand, is the architect.

**Mr. P. W. Barlow, C.E.**, died at his residence, Lansdowne Road, Notting Hill, on the 20th inst., aged 76 years.

**A Company** has been formed for the purpose of building, in neighbourhoods where there is an urgent want of such accommodation, dwellings for the artisan class which will combine the most perfect sanitary arrangements with a certain element of architectural effect, so as to avoid the barrack-like appearance so generally objected to.

**The Right Hon. the Lord Mayor** has signified his intention of receiving and entertaining the members of the Municipal and Sanitary Association of Engineers and Surveyors on the occasion of the annual meeting, which is to be held in London at the end of June.

**Messrs. Medland & Son**, architects, Gloucester, have prepared plans for new Board schools at Tredworth.

**The Court of Common Council** intend to obtain designs from four eminent artists for equestrian statuary to be placed on the pedestals at Blackfriars Bridge, for selection therefrom of four subjects.

**The laying of the Track** on the last unfinished section of the Canadian Pacific Railway, near Jackfish Bay, has been completed. The rails have now been laid continuously from Halifax in Nova Scotia to the coast of British Columbia.

A Business Supplement

# The Contract Reporter.

to The Architect.

LONDON, MAY 30, 1885.

## NOTICE TO THE PUBLIC.

By the Post Office arrangements THE ARCHITECT can now be sent to any part of the United Kingdom by an affixed Halfpenny stamp; hitherto the postage has very frequently been twopence per copy. The Publishers will be happy to forward, for 19s. 6d. per annum, post paid, THE ARCHITECT, to residents in towns and neighbourhoods to which there is no easy access by railway. Terms for the half-year, 10s.

Our readers are invited to address us on subjects of interest to themselves or the public. We shall be always ready to insert letters asking for a solution of any suitable questions of a professional or practical nature, and to receive replies to such inquiries.

INTERNATIONAL HEALTH

3 Silver and 4 Bronze Medals

[Telephone No. 3,525.  
EXHIBITION, 1884.

Awarded for Sanitary Appliances.

# HENRY CONOLLY.

LIMITED,  
MANUFACTURING SANITARY ENGINEERS,

Call the attention of Architects, Surveyors, and Builders to their Closets, the advantages of which will be readily seen by the accompanying Illustration.

## THE "SAFETY" VALVE WATER-CLOSET,

WITH

Conolly's Reversible Trap (Patent No. 3,754).

This drawing illustrates an improvement in the trap of a Closet, which admits of the outlet being placed in any position to suit the soil-pipe. This object is attained by means of a collar, which is similar in shape to that of an ordinary Valve-Closet. The base of the collar being round is flanged A; this is attached to a corresponding flange B, formed on the end of Trap by means of screw bolts, and from the drawing it will be seen that the outlet can be fixed in any position. It is obvious that this system can be adopted in every case where a separate Trap is employed.

The "Safety" Valve Water-Closet, like the "Nestor" as regards the Basin, is made with a cast lead trap above the floor line. The Trap is constructed so that the water-line is within 1½ in. of the seating of the Closet; therefore it will be seen if there become any defect in the indiarubber seating, the trap still remains sealed; by this means the necessity of a ventilating pipe is also dispensed with, also the old system of having a weepin pipe from the supply to the Lead Trap fixed in the box of Closet, there being no space for the generation of gases. The overflow arm is also protected from the possibility of soil corroding the edge of pipe, as the clack is made to open against it.

CAN BE SEEN IN ACTION IN NEW SANITARY SHOW-ROOM.

53 & 55 Hampstead Road, 169 & 171 Drummond Street.  
WAREHOUSES—TOLMERS SQUARE, N.W.

**BERWICK-ON-TWEED.**

**NOTICE OF REMOVAL.****BELLMAN'S PATENT GULLY.**

*This Gully possesses the following advantages:—*

**Receives and disconnects one Rain-water Pipe and Three Waste Pipes.**

**Avoids all Splashing.**

**Forms Drain for Area or Surface.**

**Ventilates the Pipes and Trap. Is easy of Access for Clearance.**

The ordinary P or S trap to be used in connection with Gully being in a separate piece, can be placed at any angle to meet the drain exactly, thus insuring a perfect joint, the Gully being fixed at right angles. This is a great advantage over other arrangements made with the trap in one piece.

*The Holes for Rain-water Pipes are made both Circular and Square and of various sizes.*

DESCRIPTIVE CIRCULAR ON APPLICATION.

**THIS GULLY IS HIGHLY RECOMMENDED by Authorities on Sanitary Matters.**

PRICE AT DEPOT:—EDWARD ST., DORSET SQUARE, N.W., 8s. 6d. each.

Also SINGLE GULLIES, for Sink Wastes only, price 3/9 each.

**BELLMAN & IVEY,**

AS SUPPLIED TO 600 PUBLIC HEALTH BODIES.

The Sanitas Co., Limited, Bethnal Green, E.

**GRUNDY'S PATENT**  
**WARM-AIR**  
**VENTILATING FIRE GRATE.**

The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.

*TESTIMONIALS.*

"9 Victoria Chambers, Westminster, S.W."

"Sir,—I have much pleasure in testifying to the efficiency of your patent Warm-Air Fire Grate. It has been very successful, and given every satisfaction where I have used it.  
Yours, &c.  
"To Mr. Grundy."  
JAMES WEIR, F.R.I.B.A."

"Baptist Chapel, Clapham Common, London. Richard Webb, Pastor, 10 Grafton Square."

"February 15, 1884.  
"DEAR MR. GRUNDY,—I have pleasure in testifying to the excellency and efficiency of your patent Fire-Grate. It is the most charming invention for heating a large room I have ever known. I shall have pleasure in showing it to anyone who wish to have their schools or rooms pleasantly and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool, July 1884.

"DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public.  
"Mr. John Grundy."

From Hon. and Rev. G. G. C. Talbot, M.A., Withington Cheltenham.

"DEAR SIR,—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen.  
"Mr. John Grundy."

From F. J. Yates, Esq., Architect, Birmingham.  
"The best of the kind I have seen. I shall have pleasure in securing their adoption whenever opportunity offers."

Apply to JOHN GRUNDY, 30 Duncan Terrace, City Road, London.  
Works—TYLDESLEY, near MANCHESTER.

**VENETIAN ENAMEL MOSAIC****FOR MURAL DECORATION.**

Mosaic Works conducted on the same principle as in Venice  
and Rome by

**A. CAPPELLO,**

472 KING'S ROAD, CHELSEA, LONDON, S.W.

Established in 1880.

15 YEARS IN ENGLAND WITH DR. SALVIATI.

The above Factory is established in London for the purpose of  
making the Venetian Enamel Mosaic Work an English trade,  
and to reduce the cost to half the price that has been hitherto  
charged abroad or by the London agents.

See "Building News," Oct. 12, 1883, in reference to the  
Mosaic Pictures for the new Church of the Brompton  
Oratory, executed by this Establishment.

Gold Enamel Mosaic Work at 15s. per sq. ft.  
Venetian Enamel Mosaic Figure Work at  
20s. per sq. ft., including expenses of Fixing.

**MOSAIC PAVEMENTS.**

TO  
ARCHITECTS, BUILDERS,  
AND  
CONTRACTORS.

**STEEL CUT NAILS!!**

The modern and important discovery in the process of making  
Steel has so reduced the price, that Steel Cut Nails of the well-  
known "Mitre Brand" can now be supplied at only 1s. 6d. per  
cwt. more than the price of the ordinary Common Iron Cut  
Nails.

The Steel Cut Nails are far superior in quality and more uni-  
form in size than any wrought or hand-made Nails yet pro-  
duced, and being lighter in weight than ordinary Iron Cut Nails  
and free from wasters, they are found cheaper in actual use than  
common Iron Cut Nails at 1s. 6d. per cwt. less.

These Steel Cut Nails are specially suited for Builders, Joiners,  
Coopers, Packing-Case Makers, &c., and a single trial is sufficient  
to convince any one of their superior quality and cheapness.

**PATENT WROUGHT STEEL NAILS.****OVAL WIRE NAILS.**

**G. & T. EARLE,****HULL,**

MANUFACTURERS OF LIGHT, DARK AND PORTLAND CEMENTS,  
LIAS LIME AND MASTIC,  
PLASTER PARIAN, KEEN'S PARIS WHITE, HAIR LATHS, ETC.

EARLE'S PORTLAND CEMENT is the best adopted for  
stucco work, and for use in sewage works and the construction of  
Gas Holder Tanks.

EARLE'S LIGHT ROMAN CEMENT sets very rapidly, and  
is specially useful in cases where the sea or a tidal river has to be  
contended with.

**FIXING BLOCKS.****WRIGHT'S FIREPROOF FIXING BLOCKS.**

(PATENTED 1881.)

ORNAMENTAL  
PARQUET.  
—  
DEAL  
BACKING.

# STAINS FOR WOOD FLOORS.

LIGHT OAK.

Applied to Ordinary Deal gives an exact imitation of Old Polished Oak Floors.

IMMENSE SAVING IN THEIR USE,

As no size or varnish is required, the application of one coat only taking the place of two coats of size, one of stain, and one of varnish by the ordinary process.

INVALUABLE FOR THE BORDERS OF ROOMS,

As they do not scratch like ordinary varnished surfaces, and the cost of staining would be about 1½d. a square yard, as against 4s. or 5s. per square yard for carpet.

GREAT PREVENTIVE TO CONTAGIOUS DISEASES.

Dr. Koch, in a recent lecture on Cholera, stated that polishing and dry-rubbing floors was a greater protection than washing floors. Prices, 10s. 6d. per gallon; 6s. 6d. per half-gallon; 4s. per quart. Half a gallon will do a 3-foot border round a large room.

FOR ARCHITECTS, SURVEYORS, ENGINEERS, ETC.

One Shilling each. Carriage paid on receipt of Fourteen Stamps.

**DIRECTIONS.**—Rub down Indian Ink, or any colour, in pure water, then add two or three drops of the Indelible Water to the consistency required; line in the drawing as usual, and let it stand until thoroughly dry. The drawing may be cleaned and coloured or even washed with soap and water without fear of destroying the sharpness of the line.

Messrs. SYKES & CO., CLOUGH EDGE, Glemscar Road, HUDDERSFIELD.

**TRADE NOTES.**

THE whole of the basements of the new Hôtel Métropole are illuminated by the Patent pavement lights of Messrs. Hayward Bros. & Eckstein, of Union Street, Borough, S.E. The light obtained is excellent, and the result generally is most effective. The proprietors of the Hôtel Métropole had previously adopted the same system for the basements of the First Avenue Hotel, Holborn, W.C.

The chancel of St. James's Church, Handsworth, Birmingham, has received a stained east window, the gift of Mr. Joshua Horton. The window consists of four lights and tracery. The Birth, Crucifixion, Resurrection, and Ascension of Our Lord are depicted, each subject being surmounted by an elaborate canopy, and in the lower compartments of the lights are angels bearing shields with the various emblems of the Crucifixion. The tracery has been treated with a conventional arrangement of the lily and passion flower. Mr. Samuel Evans, of West Smethwick, executed the work.

A FLOWING artesian spring has just been tapped by an Abyssinian tube well, bored by Messrs. Le Grand & Sutcliffe to a depth of 72 feet at the North Northumberland Aerated Water Manufactory, Alnwick. The boring had reached the upper series of the limestone shales and sandstone when the water was struck and rose 8 feet above the surface. Owing to the hydrostatic pressure, immediate means had to be taken to prevent flooding of the neighbouring cellars.

MR. T. HILL, J.P., has presented a screen and reredos to St. Mary's Church, Nottingham. Messrs. Bodley & Garner designed the screen, which was executed by Messrs. Rattee & Kelt, of Cambridge. The screen is made of English oak. The reredos is the work of Messrs. McCulloch, of Kennington Road, Lambeth, London.

MR. WILLIAM FISHER, of Paradise Street, West Bromwich, has issued a supplementary catalogue of school desks and school furniture manufactured by him. The catalogue is well illustrated, and all the articles are shown

exactly, so that the particular piece of furniture wanted can readily be selected, the size, price, and other necessary information being added in a clear, concise manner. This old-established firm has a reputation for its manufactures, and over 800 schools have been supplied by the firm with school furniture, which includes every requisite, from teachers' desks, library tables, &c., to blackboards, umbrella-stands, &c. The registered West Bromwich convertible desk is one to be particularly commended.

**LAUNDRY AT PARTICK.**

THE Great Western Steam Laundry Company's Works situated at Crow Road, Partick, and said to be the largest in the kingdom, have been opened. The works, which are erected on the Scotstoun estate, cover an area of four acres, three of which are reserved for drying in the open air, while the fourth is covered by the laundry proper. Entering by the front and main entrance, to the right is a waiting-room, while to the left is the secretary's office and directors' room. Passing along the lobby to the right, on the left hand side are two rooms fitted with machines for cleansing carpets. Adjoining is the washing-room—136 feet long by 33 feet broad—fitted with washing machines, dash wheel, and hydro extractor. In line with this room is the drying department, where by artificial heat clothes are dried when the elements are unfavourable. Close to this is the ironing-room, measuring 100 feet by 72 feet, equipped with several Decoudun and other ironing machines. There are rooms for the special treatment of lace curtains, flannel goods, airing clothes, receiving and despatching goods, &c. The machinery is driven by an engine of 25 horse-power nominal, which is supplied with steam from two steel boilers, 26 feet long by 7 feet in diameter. Twenty-four thousand pounds have been expended on the works. The builders were P. McKissock & Co., Glasgow; the joiner, James Watson, Partick; the architect, Russell McKenzie, Aberdeen; the engineer, Alexander Leith; while Mr. Robertson, Aberdeen, superintended the construction of the large plant.

**THE NEW PREMISES OF THE MANCHESTER AND LIVERPOOL DISTRICT BANK.**

THE new premises opened for business last week by the above bank in Southport, form one of the most important blocks of buildings in the town. They are situate at the corner of Hind Hill Street and Market Street, in the side space just opposite St. Luke's Church. The building faces both streets, the bank entrance being at the corner, and is in the Classic style of architecture, faced with stone. The banking-room is spacious and well lighted, and has windows on the sides, with neatly panelled and moulded plaster ceiling. The floor behind the counter is laid in oak blocks on concrete, and in front of the counter are ceramic mosaic tiles. The fittings are very chaste, and are in pitch pine, except the counter, which is Honduras mahogany. The vestibule to the bank is circular in plan and has a ceramic floor, as the bank, and communicates direct with the manager's consultation-room and the bank. The safe is made of steel and surrounded with thick concrete, and approached by double fireproof doors by Messrs. Chubb. This safe contains another of Messrs. Chubb's double patent cash safes. Attached to the bank is a manager's house of moderate size. The whole of the place is heated with hot water, and great care has been bestowed upon the ventilation, both as to the admission of fresh air and the extraction of foul air. The premises have been designed and carried out under the superintendence of Messrs. Maxwell & Tuke, of Manchester and Bury, by Messrs. Diggle Brothers, of Heywood.

**BOTANICAL GARDENS, BIRMINGHAM.**

THE new exhibition hall, corridors, and plant-houses lately erected at the Botanical Gardens, Edgbaston, have been opened. Ever since the palmhouse was built in 1870, it had been felt more and more desirable to complete the line of buildings on the terrace, especially as the new house was essentially a conservatory

for special plants only, and could do little towards relieving the congestion in the growing-houses. Additional conservatory accommodation, but far more additional stove and greenhouse protection, was urgently needed, and the want of this was felt more year by year as the old domehouse and its wings became more and more dilapidated. In 1883 a sub-committee was appointed with instructions "to consider the best plan for dealing with the present dome conservatory and greenhouse on either side, and the financial questions connected therewith." The sub-committee reported that the old buildings on the terrace must be removed or substantially repaired; that if removed others must be erected, or the society will suffer in prestige, and consequently in income; and that it was not advisable to attempt a partial adaptation of the old buildings in connection with new ones. On these considerations they submitted plans and estimates, showing that to efficiently repair the old houses would cost, approximately, 1,000*l.*; to erect a suitable range of new ones in their place, 3,200*l.*; and in either case about 700*l.* would be required in addition to pay off the existing debt, without making provision for which the sub-committee thought it would be useless to launch into fresh expenditure. A special committee was appointed to canvass for funds in the early part of last year, and at the general meeting in June they were happily able to report that something like 3,300*l.* was already promised. The sanction of the shareholders having been given, plans were prepared, and a contract entered into with Mr. Henry Hope, of Birmingham. The work now completed, except as to some details, comprises the exhibition hall, 54 feet by 40 feet; the corridor, 98 feet by 19 feet 6 inches; the recess to corridor, 54 feet by 21 feet; four stove and greenhouses, each about 35 feet by 24 feet, besides an entrance corridor and ladies' cloak-room, a general out-house, a boiler and stoke-hole, with new boilers and heating apparatus complete, a large stand for the orchestra, and some alterations in the house, with a complete set of sunshades. A potting-shed and a new wall to the back yard have yet to be built, and

provision made for the purchase of a large number of seats, together with other minor details. The whole of the above work already completed will cost just under 3,000*l.*, and it is hoped, after making provision for the debt of 700*l.*, that the remainder of the work yet requisite to finish up the other jobs in connection with the new buildings may be executed, so that the total sum expended shall be kept within the original estimate of 4,200*l.* Messrs. Chance Brothers, with their usual generosity, have assisted greatly in keeping down the expenses by supplying the whole of the glass at cost price.

**BUILDING FOR EARTHQUAKES.**

MR. MILNE, of the Tokio College of Engineering, Japan, says on this subject:—The buildings usually recommended are constructed of masonry bound together with cement and iron to give the greatest possible resistance to stresses of all descriptions. Structures of this order may be compared with a strongly-built box which might be rolled down the side of a steep mountain, and yet but seldom suffer injury. Houses like these have withstood the shakings we have in Tokio with fair success, but should it ever happen that they were shattered it is inevitable that disastrous consequences would attend their ruin. Another drawback to their employment is their cost. The second type of building is one constructed with wood or iron. A structure of this order, when well built, may be compared with a wicker basket which, like the strongly-built box, might also be rolled down a mountain side and sustain but little damage. In this case safety depends upon lightness and flexibility. The chief objections raised against houses like these are want of durability, dangers consequent on fire, and, in the case of large buildings, their appearance. If we take away the heavy roof of tiles we have a building of this sort in the ordinary dwelling of the Japanese. A noticeable feature in these houses is that they are not firmly attached by foundations to the earth, but rest loosely on

**THE GREAT PROBLEM OF THE XIX<sup>TH</sup> CENTURY.****VENTILATION  
WITHOUT DRAUGHT.**

The hitherto unsolved problem of "Ventilation Without Draught" is to be seen practically illustrated at FREDERICK HENRY SMITH'S Test Room, No. 68, 52 Queen Victoria Street, E.C., Patentee of the Automatic Siphonic Aspirator System of Ventilation. A personal inspection invited.

*Extract from the Annual Report of the "French Hospital and Dispensary," issued 29th January, 1885.*

We have also to return our best thanks to Mr. Smith, who undertook gratuitously to repaint one of our wards and to apply a new system of ventilation of his own invention, which was very successful.

*Letter from David Urquhart, Assistant Engineer to Colonel Sir Francis Bolton, C.E.*

F. H. SMITH, Esq., 52 QUEEN VICTORIA STREET, E.C.

4 THE SANCTUARY, S.W., LONDON: NOVEMBER 22nd, 1884.

In reply to your inquiry, I have much pleasure in certifying that your system of ventilation as applied to the "Island Room" of the illuminated fountains at the Health Exhibition reduced the temperature during the displays from about 110 deg. to about 70 deg., and thus enabled the men to perform their duties without inconvenience.—Yours faithfully,

DAVID URQUHART.

*Extract from the TIMES of March 14, 1885, page 7.*

"VENTILATION WITHOUT DRAUGHT.—This desideratum appears to be accomplished by a siphonic system devised by Mr. Frederick H. Smith, at whose offices, 52 Queen Victoria Street, London, we recently inspected the arrangement. The air supply is conducted into the apartment from the external atmosphere by means of air ducts, which terminate in distributing passages at the floor level. The exit for the vitiated air is placed in the ceiling, and consists of two tubes, a large and a small one, running parallel to each other between the floor joists in the case of rooms having others over them. In the case of rooms on top floors, or those having the roof directly over the ceiling, the tubes are placed concentrically, but the action and results are the same. The larger of the two tubes carries off the vitiated air, while the smaller one forms an induction tube for cold air, its outer extremity being open to the atmosphere. These two tubes or conduits are so connected that the passage of the heated air through the larger tube induces a current of cold air through the smaller one in a continuous stream. The result is a rapid clearing away of all deleterious gases and products of combustion as they accumulate, and the preservation of a pure atmosphere at an equable temperature in the apartment. In a small room at Mr. Smith's offices in which five large gas-jets were burning, the atmosphere was apparently quite innocuous at the level of about 7 feet, the temperature being about 60 deg. Fahr. At a higher level, however, and especially near to the ceiling, the temperature was high and the air greatly vitiated. It was demonstrated that this vitiated air was being drawn off through the exit tube, which acted as a powerful sucker. After turning off the gas-burners, and upon the temperature of the room generally becoming lowered and equalised, a feeble upward action was still maintained in the upcast tube, but there was no down-draught whatever. The system has already been applied to a church and other buildings with acknowledged success."

squared stones or boulders buried in the ground, the result of which is to partially prevent the transmission of momentum from the moving ground to the house which rests upon it. To test how far this principle is applicable to buildings I have during the last year made observations on a house resting upon cast-iron balls. This experiment was very similar to one carried out by Mr. David Stephenson with regard to the lamp tables in several of the lighthouses on the coast of Japan. For several reasons, among which were the movements produced by wind, I abandoned the balls, and now have my house resting at each of its piers upon a handful of cast-iron shot. These shot, which are about the size of buckshot, have so increased the frictional resistance to rolling that the house is practically astatic, and the motion in the house is in most earthquakes only about one-tenth of what it is outside. In appearance the building is like other buildings. That it had freedom at its foundations would not be observed, unless specially pointed out. From these experiments I am fully convinced that light one-storeyed buildings like bungalows built of wood or iron, resting at their foundations upon layers of small cast-iron shot, may be constructed to withstand the effects of earthquakes, while neighbouring buildings are reduced to ruin.

Another result is the fact that the principal motion of an earthquake at a distance from the point immediately above its origin, is chiefly superficial. In Tokio moderately hard ground earthquakes, which have been sufficiently intense to crack a building, are hardly perceptible at the bottom of a pit 10 feet deep. The result of this discovery is leading me to make experiments on free foundations. A third plan which may be adopted as a defence against earthquakes is to make a seismic survey of the district in which we intend to build. As a result of the careful measurement of very many earthquakes, I can say that we may have three or four observatories not more than 800 feet or sometimes even 100 feet apart, at which the records for the same earthquake will be so entirely different that the diagrams of the motion at the stations will hardly present two points

in common. Here, together with numerous details of construction, there are two chief principles which may be followed. One of these is to so arrange our building that its various parts shall have similar vibrational periods. The second is to remember that we have to deal with stresses and strains applied more or less horizontally, and not with vertically applied forces such as are usually provided against in ordinary engineering formulæ. As an example of a violation of the first principle, I may mention the contact of brick chimneys with a frame building. Either, when shaken separately, may stand; but when shaken together, owing to their difference in vibrational period, they become mutually destructive. As an example of a violation of the second principle, I may point out the unstability of an ordinary brick arch to horizontal stresses, as compared with the perfection of its stability when only intended to withstand stresses due to gravity. Both of these principles I have seen violated with ruinous results, and therefore I now refer to them not as matters of theory, but as principles based upon experience.

#### PLANNING MODEL DWELLINGS.

MR. DAVIS, the manager to the Birmingham Improvement Committee, has drafted the following suggestions:—

In designing a block of dwellings for the accommodation of a large number of families, a leading feature of the plan should be the preservation of the privacy and independence of each family, and the entire disconnection of their apartments, so as to effectually prevent the communication of contagious diseases. It is also necessary that the stairs and corridors should be constructed of unflammable materials, and the houses themselves rendered fireproof by placing concrete between the floors; the latter precaution has also the effect of deadening the sound, and prevents the percolation of water from one floor to another. The plan which I have prepared shows a building four storeys in height, affording accommoda-

tion for twenty-three families, with two retail shops at the one end of the block.

Each tenement contains a sitting-room, 14 feet by 12 feet; two bedrooms, 13 feet by 10 feet, and 12 feet by 10 feet respectively; a small scullery or pantry, fitted with sink, &c.; and a closet for coals—every alternate dwelling having an extra bedroom, about 12 feet by 10 feet. A separate water-closet is provided for each family, but these are placed outside, and disconnected from the main building. To economise space, the wash-houses are placed on the roof, which can also be used for drying purposes, and as a playground for the children.

Access to the different floors will be gained by open corridors at the rear of the building, approached by a stone staircase in the centre, and as every tenement will have a separate entrance opening directly on to the corridor, the privacy of each family will be fully secured. The arrangement of the block provides for through lateral ventilation to any extent that may be desired, and as all drains will be excluded from the building, the houses cannot fail to be healthy, while the extra thickness of the walls will serve to retain the warmth to a much greater extent than in the ordinary dwellings.

I have prepared an estimate of the cost of the proposed buildings, and am of opinion the block could be erected with a plain elevation for the sum of 5,250*l*. The net income would probably amount to about 260*l*. per annum, which is equal to 5 per cent. on the outlay, and a ground-rent of 1*s*. per yard for the land would reduce the profit to the extent of 1 per cent. The success of the undertaking would depend to a great extent on the suitability of the site selected, and to make the experiment satisfactory the buildings must be placed in a central position, and free from all objectionable surroundings.

The occupation of the houses by a respectable class of tenants would tend to increase the value of the shop property in the immediate neighbourhood, and while the committee would probably have to sacrifice something in the ground-rent of the land on which the dwellings

were erected, they would no doubt enhance the value and facilitate the letting of the adjoining land for shop purposes. It was generally contended by the witnesses who gave evidence before the Artisans' Dwellings Inquiry Committee last year, that the Birmingham workmen were averse to, and would not live in, houses erected in "flats;" but the success which has attended the adoption of the system elsewhere justifies, in my opinion, a trial of the experiment here; and, notwithstanding the fact that the average population in the model dwellings in London is a far higher one to the acre than can be found in the most densely populated parts of the metropolis, the death-rate is considerably lower, while a much larger area is reserved for ventilation and recreation purposes.

WORKMEN'S DWELLINGS.

THE Improvement Committee have prepared a report to be submitted to the Birmingham Town Council in reference to a project for building a block of dwellings on the flat system in Dalton Street. The report states that almost invariably the blocks of model dwellings have been provided either by municipal bodies or by companies promoted for the purpose; and as there does not appear to be any probability of such a company being formed in Birmingham, and bearing in mind the difficulty which exists of obtaining the assistance of private enterprise, an experiment might now wisely be tried by the Corporation, and with that object they recommend the Council to authorise an application to the Local Government Board for the requisite powers to erect dwellings for one hundred families on a portion of the land acquired under the Artisans' Dwellings Act, and also for authority to borrow a sum not exceeding 20,000*l.*, to provide the necessary capital. A portion only of these dwellings should be proceeded with in the first instance, and plans have been prepared for a block containing twenty-three tenements and two lock-up shops, the estimated cost of which is 5,250*l.* The unoccupied land in Dalton

Street appears to be the most suitable site for the purpose, and ample land would remain for the erection of other blocks if the experiment proved successful. The committee are actuated with a desire to provide dwellings of the best description as an example to be followed hereafter, and as a standard for houses for workmen of the better class, whose employment necessitates their living within easy reach of their work, and whose earnings will enable them to pay the moderate rental which will be fixed for the accommodation which it is proposed to provide. The committee anticipate that, after providing for the charges on the borrowed capital, and making the usual payments for rates and other expenses, a balance will remain to be carried to their revenue account as a ground rent for the land occupied. The demolition of the insanitary houses, and the consequent depopulation of this district, has had a prejudicial effect on the value of the shop property belonging to the Corporation in the immediate neighbourhood, and the erection of the proposed houses would, no doubt, tend to improve the letting value of these shops.

*Liverpool.*—In 1868 the Liverpool Corporation erected a block of dwellings—"St. Martin's Cottages." The cost of the block, which contains 146 tenements, was 14,756*l.*, equal to 101*l.* per dwelling, and a further sum of 3,172*l.* was paid for the site. The buildings are arranged in two, three, and four-roomed tenements, which are let, including a free supply of gas, and the use of a scullery in common to two families, at the following average rentals, viz. :—

|                 |                                  |
|-----------------|----------------------------------|
| Two rooms . . . | 3 <i>s.</i> 6 <i>d.</i> per week |
| Three " . . .   | 4 <i>s.</i> 6 <i>d.</i> "        |
| Four " . . .    | 5 <i>s.</i> 6 <i>d.</i> "        |

The rooms, however, are small, the living rooms being only 12 feet 8 inches by 9 feet 6 inches, and the bedrooms 13 feet by 8 feet, and 13 feet by 6 feet 4 inches. During the fifteen years the houses have been occupied the returns have averaged 4*l.* 5*s.* 5*d.* per cent.; but for the year ended August 1884 the net receipts were only 643*l.*—equal to 3*l.* 11*s.* 8*d.* per cent. on the outlay. In addition to the above, the Corpora-

tion are now erecting thirteen blocks of dwellings, containing 272 tenements and twelve shops, on a portion of the "Nash Grove" area, which was cleared by them under the Artisans' Dwellings Act of 1875. The area comprised 22,400 square yards of land, and the total cost of acquiring the whole of the interests was 67,000*l.* The Corporation have allocated 9,000 yards for the purpose of erecting these dwellings, and the buildings themselves will occupy 3,200 yards, the remaining 5,800 yards forming a recreation ground at the rear of the blocks. The houses will be five storeys high, and will form a quadrangle, with frontages to four streets, one of the street frontages being utilised for the twelve shops. There will be two three-roomed and two two-roomed tenements, approached by a separate staircase, on the four lower floors of each of the several blocks, with a laundry, two sculleries, and two water-closets for the use of the four families, while the upper floors will be divided principally into single-room tenements. The single rooms are 13 feet by 19 feet, with a recess for a bed; the two-roomed tenements comprise a living-room 13 feet 1 inch by 12 feet 4 inches, and a bedroom 13 feet 3 inches by 9 feet 7 inches; and the three-roomed tenements have an additional bedroom 13 feet 1 inch by 8 feet 6 inches. The 272 dwellings are estimated to cost 55,000*l.*, exclusive of the land, and it is anticipated that the net return on this outlay will be at the rate of five per cent. per annum. The rentals are fixed as follows :—

|                   |                                   |
|-------------------|-----------------------------------|
| One room . . .    | 2 <i>s.</i> 9 <i>d.</i> per week. |
| Two rooms . . .   | 4 <i>s.</i> 3 <i>d.</i> "         |
| Three rooms . . . | 5 <i>s.</i> 3 <i>d.</i> "         |

In Ashfield Street, Liverpool, a company promoted by some of the leading inhabitants of the town has erected a block of 150 tenements, somewhat similar to the St. Martin's cottages, at a cost of 22,000*l.*, or an average of 51*l.* per room. The rents were slightly higher than at St. Martin's, but, as the company had several unoccupied dwellings, a reduction has been made, and the houses are now more fully occupied in consequence. The company has made an average profit of a little over four per cent.

INTERNATIONAL HEALTH EXHIBITION :  
GOLD MEDAL  
AWARDED.

REDUCTION IN PRICE.  
THE SUPERIORITY OF  
THE "HYGEIAN ROCK"  
BUILDING COMPOSITION

Over all other Material for rendering Walls Damp-proof and increasing their strength, is now universally acknowledged by the leading Architects, Engineers, and Contractors.

To meet the rapidly-increasing demand, the Patentee has recently made extensive additions to his Machinery and Plant, which enables him to effect

A REDUCTION OF OVER 25 PER CENT. IN THE PRICE.

WILLIAM WHITE,

Head Office and Works :—BELMONT ROAD, ABERGAVENNY.

A brick on flat and one on edge wall suitable for Cottages, or where great economy is required. It is quite damp-proof and equal in strength to a 14-inch wall built with mortar only.

A wall built with two half-bricks on the flat is much stronger than an 18-inch wall built in the ordinary way.

THE SOFTENING AND PURIFICATION OF WATER.

AWARDED GOLD AND SILVER MEDALS AT THE INTERNATIONAL HEALTH EXHIBITION.

The PORTER-CLARK PROCESS is largely employed in County Asylums, Hospitals, Schools, and private Mansions, and is adopted upon a much larger scale in many Industries. By this process the Lime and Magnesia are removed from the water, together with organic impurities and the calcareous deposits in pipes and boilers.

JOHN HENDERSON PORTER, Patentee, 1 & 2 Tudor Street, London, E.C., furnishes the necessary Plant.

for the ten years previous to 1883, the lowest dividend being three and a half per cent., declared in that year.

In London an immense number of dwellings had been built in the last twenty years mainly by the Trustees of the Peabody Donation Fund, the Improved Industrial Dwellings Company, and the Metropolitan Association for Improving the Dwellings of the Industrious Classes. The capital expended by these three Associations alone amounts to 2,312,000*l.*, and the number of persons housed by them is nearly 50,000. The Trustees of the Peabody fund have expended, up to December 31 last, the sum of 1,170,787*l.* on the purchase of sites and the erection of model dwellings in different parts of the metropolis.

Seventeen groups of buildings were completed at the end of last year, accommodation being provided for 4,550 families or 18,450 persons, the number of separate rooms being 10,144. The sites covered were purchased, in six instances, from the Metropolitan Board of Works at a cost of about 5*s.* per square foot, the land having been acquired by the Board of Works under the Artisans' Dwellings Act at a cost of about 21*s.* 6*d.* per square foot. The loss to the Metropolitan Board of Works on these six sites amounted to about 600,000*l.*, which is, in effect, a contribution of that sum by the ratepayers towards the erection of artisans' dwellings. The gross receipts from rents in 1884 were 55,486*l.* The payments for rates, water, repairs, superintendence, &c., amounted to 15,769*l.*, the expenses of management were about 1,155*l.*, and the interest on loans absorbed 11,106*l.*, leaving a net profit of 27,456*l.*

The rents charged are as follows:—

|                  |  |
|------------------|--|
| For 1 room . . . | 2 <i>s.</i> to 3 <i>s.</i> 6 <i>d.</i> |
| „ 2 rooms . . .  | 3 <i>s.</i> to 5 <i>s.</i> 6 <i>d.</i> |
| „ 3 „ . . .      | 4 <i>s.</i> to 7 <i>s.</i> 3 <i>d.</i> |
| „ 4 „ . . .      | 7 <i>s.</i> to 7 <i>s.</i> 6 <i>d.</i> |

The average rent of each room being 2*s.* 1½*d.*, and of each dwelling, 4*s.* 8¾*d.* These charges in all cases include the free use of the wash-houses, baths, &c. The rents in the Peabody Buildings appear to be fixed on a lower scale

than those charged by other associations providing similar accommodation, the object of the Trustees being to limit their profit to 3 per cent. The whole of the buildings are arranged on much the same plan, a laundry, with two water-closets, being provided on each floor for the use of ten rooms, which are occupied as a rule by four families. The average cost of the buildings, including the laundries, baths, &c., is estimated at 75*l.* per room. The authorities of the City of London are also engaged in erecting at a cost of nearly 70,000*l.*, five large blocks, capable of housing 1,000 people, on land in Petticoat Square.

#### EMPLOYERS' LIABILITY ACT.

At the Leeds County Court, before Judge Greenhow, actions were brought by Dennis Foley and Daniel Conolly, bricklayers' labourers, to recover the sum of 80*l.* each from Edward Oakes, builder and contractor, Hunslet, for injuries sustained by them on January 24. The case of Foley was first proceeded with. Mr. Dunn appeared for the plaintiff, and Mr. E. Tindal Atkinson, barrister, represented the defendant. From the statement of the plaintiff it appeared that he was employed, with others, at Messrs. Kitson's premises, where the defendant was carrying out some structural alterations, the work being under the superintendence of Samuel Hirst, his foreman. A girder was being lowered from an upper storey of the building, when it broke away and came crashing through several floors, carrying brickwork and debris with it. Hirst told the men that the rubbish must be got out within a few hours, and ordered them to do the work. The plaintiff pointed out that a quantity of bricks were hanging, almost ready to fall, from above, and said no one should be called upon to work underneath until they had been knocked away. Hirst, however, said "there was no time for knocking down, and if he didn't want to work, he could go home." Considering that that would mean his discharge, the plaintiff went to work with others, but

bricks fell from time to time. He was struck on the head, rendered unconscious, and remembered nothing more until he found himself in the General Infirmary. He remained there for three weeks, and was an out-patient for three months and two weeks. He could no longer ascend ladders with loads upon his head, and had only earned 35*s.* since the accident happened. At the time of the accident he was earning 1*l.* 0*s.* 10*d.* a week. In cross-examination, the plaintiff stated that he had had three different masters since the accident occurred, but simply because he could not carry things on his head they had discharged him. There was a way of getting to the rubbish that was to be removed without the men having to come under the overhanging bricks. That was the safest but not the quickest way. Hirst told them repeatedly not to go under the place where the materials were hanging, but he sent them to another portion still more dangerous. For the defence Mr. Atkinson said his case was a flat denial of the main issues upon which the two plaintiffs relied for the purpose of recovering damages. These men insisted upon doing that which they were warned not to do. Hirst had told the plaintiffs to cease work altogether, and to go away from the place where the hole was until he had found a chain and properly secured the girder. In his absence the plaintiffs went on with the work. The storekeeper could not be found, and Hirst went away a second time to try to get a chain; and it was during his absence that the accident happened. The learned counsel's statement was corroborated by Hirst and several of the men who were engaged at the same work as the plaintiffs. His Honour said he did not believe that Hirst gave orders to clear out, but that he only gave orders to remove to the other side of the heap. Having set these men, against their will, to do a most dangerous job, he ought to have remained to see that they obeyed his orders. His Honour gave a verdict for the plaintiff for 40*l.*, and said that if the parties were willing he would give the same decision in the case of Conolly. This was agreed to, and a verdict was also entered for the plaintiff Conolly for 40*l.*

# The Architect.

## THE WEEK.

M. BOUGUEREAU, having had seventy-two votes, has at length obtained the Médaille d'honneur of the Salon. It is only fair that the President of the Society of Artists should have his turn, and last year he nearly gained the medal by the *Bacchus* which was afterwards exhibited in Bond Street. M. BENJAMIN-CONSTANT stood second in the voting with sixty-three votes, and M. HUMBERT third with forty-nine votes. Last year there was no award of the Médaille d'honneur; this year no picture has been considered worthy of a first-class medal. Second-class medals have been voted to MM. FRIANT, WEISZ, MATHEY, BRAMTOT, PRINCETEAU, DARVAUT, FOUBERT, A. EDOUARD, LEWE-MARCHAND, BERTEAUX, PETIT-JEAN, CLAIRIN, HAREUX, and LAGARDE. A sufficient number of votes was not secured by any artist to gain the Médaille d'honneur in sculpture, but M. MERCIÉ stood highest. MM. DAILLION, DESCA, CROISY, CARLÈS, and ROTY obtain first-class medals.

THE Medal of Honour for architecture in the Paris Salon has been awarded to M. FRÉDÉRIC LALOUX. It is not for a work that is to be carried out, but for a restoration on paper of an Olympian temple. First-class medals have been obtained by M. LEFORT (*Palais de Justice, Rouen*), M. QUATESOUS (*Design for a Salle des Séances Publique*), M. BOILEAU fils (adopted design for the GAMBETTA Memorial), and M. DARCY (*Restoration of the Château de Mehun sur Yèvre*). It will be seen that out of the five principal medals only two are gained by designs which are likely to find their way to contractors. The four second-class medals have been awarded to MM. HENRI PONS (*Restoration of la Ville et Château de Najac*), V. CUVILLIER (*Farm Buildings*), C. WABLE (*Decoration of a Chapel*), and E. CAMUT (*Palais de Justice, Meaux*). The winners of third-class medals are MM. NODÉT (*Château de Najac*), BACS (*Hall in the Palais de Justice, Brussels*), CHAÎNE (*Château du Grand Pressigny*), and PONCET (*Design for a Ceramic Museum*). Honourable mention has been made of the works of MM. P. BOUSSAC, P. BERNARD, L. CADDAN, H. DEGEORGE, H. DESPIEU, V. HOURLIER, E. LACOMBE, G. LECHATELIER, G. LEROY, CH. NORMAND, P. RAFFET, and P. RENAUD.

THE annual meeting of the Old Mortality Society was held, by permission of the Dean of WESTMINSTER, in the Jerusalem Chamber on Wednesday. The society now numbers about 670 members, and its income is about 400*l*. The greater part of this sum has been expended in the work of visiting, inspecting, and reporting on the condition of tombs in remote country churches, and in assisting the incumbents to conserve them. Among the churches thus benefited are Sprowston, Norfolk; Aldham, Essex; Lusk, county Dublin; Appleby, Westmoreland; and Westminster Abbey.

UNANIMITY evidently prevails among the members of the Architectural Association, in regard to the adoption of measures to increase the efficacy of the Association as an educational organisation. This was sufficiently shown by the proceedings which took place at the special meeting held on Friday evening in last week, when a comprehensive scheme, formulated after much consideration by the Committee, was adopted, with unimportant amendments. Many details in first working the scheme will no doubt crop up, and will either naturally arrange themselves or have to be dealt with when the new conditions come into practice. But to turn from details, the putting of the scheme in work will necessitate an increase in the funds. It was therefore proposed to raise the annual subscription, heretofore half a guinea, to one guinea. This proposition was the first hitch in the proceedings, and the meeting adjourned without coming to a decision in the matter. Many of the members saw grave objections to the proposed change, and considering the objections that would certainly attend it, and the doubtful advantages that would result, it is not unlikely that the Council will see their way

to providing the extra funds that may be required in some other way. If we add that no serious difficulty need stand in the way, we merely express an opinion that is held by one whose judgment carries the seal of twenty years' experience as hon. treasurer to the Association, Mr. J. D. MATHEWS. At any rate, after all other means have been tried and have failed, the experiment of raising the subscription could be made.

ENGLISH visitors to Paris during summer and autumn will find an advantage in visiting the Institut Polyglotte in the Rue Grange-Batelière, of which the honorary director, M. LEMERCIER DE JAUVELLE, holds an important public office. It gives, as the name implies, opportunities for learning and conversing in most of the European languages, and it has the support of the Minister of Public Instruction and Fine Arts, the Minister of Posts and Telegraphs, and the Municipal Council. Conferences are held every week, and among the subjects of those in English were "GEORGE ELIOT," "English Sports and Pastimes," and "CHARLOTTE BRONTË."

A RETURN has been made of the value of the works of art belonging to the City of Paris, and it is found that the total reaches 12,256,660 frs. Of that amount about four millions represent the works in civil buildings, and eight millions those in the churches. Thus the church of St.-Eustache is put down as possessing works to the value of 700,000 frs., and St.-Germain-des-Prés 642,000 frs. The sculpture in the new Hôtel de Ville is worth 1,384,000 frs., while the statues in public places are alone valued at nearly a million. The fine monument in the Place de la République is entered at 300,000 frs. The collection of plans of Paris is supposed to be worth 1,714,000 frs., and the library and Musée Carnavalet 1,200,000 frs., and the tapestries 2,250,067 frs.

A PARAGRAPH quoted from the *Athenæum* has been going the round of the daily newspapers with an account of the injurious effects suffered by the Ansidei RAPHAEL since it was placed in the "dissipated atmosphere" of the National Gallery. Sir FREDERICK BURTON, the Director of the National Gallery, has, however, written to correct this and other mistaken statements in the paragraph, the fact being that the blemishes in the painting are visible under the present strong light, which in the gloom of the Blenheim Gallery were not remarked. The picture itself is precisely in the same condition it was previous to its removal to London.

THERE is no telling what may not happen when the turning of a penny is in view. The latest exploit of misdirected ingenuity is the manufacture of letters by Mr. RUSKIN. At any rate, the solicitors of Mr. RUSKIN have taken steps to warn the public against buying letters purporting to have been written and signed by Professor RUSKIN, as they have been led to the discovery of a manufactory of such letters, and have succeeded in tracing and withdrawing from circulation more than 280 of them. Eighty more are said to be still in the market.

THE flimsy character of the stalls and drapery around the high altar in the church of Ste.-Geneviève might be taken as evidence of the uncertainty of the tenure of the clergy. At a distance the carving and curtains appeared to be real, but they were only scene-painter's work, and could always be cleared away at a few hours' notice. For the same reason, the church contained few statues or pictures, and the congregation was always scanty. There is, accordingly, not much inconvenience through the secularising of the building. It had a hybrid character, and was as much a great hall as a church. But the facility with which the transformation was made has not given general satisfaction. The next question that will have to be considered is the fate of the wall paintings. They are essentially ecclesiastical in character, some relating to Ste.-GENEVIÈVE, some to St.-LOUIS, and commissions have been given for others depicting a similar class of subjects. So long as the building was used as a church they were apposite, but since it has become once more a Panthéon they are certainly out of place. They will probably be removed, and a different class of paintings must then be substituted.

## THE PARIS SALON.

THERE is always an absurdity about every attempt to express the character of an exhibition of paintings in one word. And yet the first question that is generally asked of a visitor to the Royal Academy or the Salon is, whether the collection is good or bad? If we were to be guided by the general opinion of the Paris journals on this year's exhibition in the Palais des Champs Elysées, there would seem to be no doubt about the quality of the work. M. ALBERT WOLFF began by saying that a visit to the Salon nowadays reminds him of the story of the Sleeping Beauty in the Wood: everything corresponds with what was seen in the year before. A host of writers have taken the cue from the critic, and when the French visitor pays his franc and passes through the turnstiles into the building, he is certain to be biassed against the pictures and statuary. It is possible that the writers in the Paris newspapers are not entirely impartial. There are many struggles taking place in the city, and apparently the journalists and the Society of French Artists are testing their relative strength. The artists have been allowed to arrange exhibitions without much official interference. So vast and exceptional a concession has persuaded them that they are omnipotent, and the power of the press is undervalued. But in France a good many governments have fallen because they could not resist the journals, and unhappily the artists are also made to feel what the pen can do. The authorities of the Society continue to meet, organise, report, and proclaim the satisfactory state of the finances which are derived from exhibitions, but never before were so many pictures remaining unsold in studios and dealers' shops. A Frenchman does not care to buy a work which has been made the subject of a delightfully malicious epigram; although, personally, he may admire it. He has to remember that his friends would be always recalling the capital things that were said about it by such-and-such a writer. He, therefore, prefers to wait, or he turns to the Hôtel Drouot, where remarkably good prices are now obtained, owing to the demand for works which have not been recently criticised.

The exhibition this year we consider to be rather above the average, although it has the drawback of many absentees whose works are always attractive. For the English visitor it has the merit of presenting fewer unnecessary nudities than usual. Much can be said in support of the dictum of INGRES, "l'Art c'est le nu," but all artists do not treat the nude in the spirit of the leader of the Classicists, and of late years paintings have been seen in Paris which were an outrage to good taste. The action of the Government, which has led to the rejection of a few works, has apparently exercised a salutary effect, and painters must feel that notoriety for a debased class of work does not pay in the long run. In spite of the interest offered by the new edition of FLAUBERT'S novels, there are, we believe, not more than two "Salambôs" among the paintings.

It would be impracticable for us to notice even one-hundredth of the pictures. All we propose to do is to select a few works which may serve to indicate the tendencies of French art at the present time. What strikes us is the general air of uncertainty about the collection. Since commissions are scarce, it is natural that artists should try and discover what patrons want, and accordingly many adopt a new line, giving proof of their versatility. There seems to be more portraits than formerly; there is an abundance of landscapes, and a vast quantity of scenes from everyday life. Several artists have had the courage to go to the Bible for subjects. We noticed more than one version of the parable of the Good Samaritan and of the story of HAGAR and ISHMAEL. M. HECTOR LEROUX, whose illustrations of ancient Roman life are always fascinating, has this year painted a small but pathetic figure of the daughter of JEPHTHAH lamenting in the mountains. M. OLIVIER MERSON has illustrated a Christmas carol, of which the subject is the arrival of the Virgin MARY and Saint JOSEPH at Bethlehem, where they seek vainly for a refuge. There is a tender grace about the work that is very rare in modern French painting. A few artists will generally be found near it who are loud in its praise, and we are surprised it has not been premeditated by the jury. M. MICHELIN, in his *Repast at Emmaus*, has attempted the very difficult task of creating a new ideal of CHRIST. It is far from resembling

the Mediæval and Italian types, and is more suggestive of a humble enthusiast in whom emotion is paramount; but there can be no question of the sincerity and skill with which the figure is worked out, or of the painter's reverence. Another remarkable version of a Scripture theme is M. PILLIER'S picture, where CHRIST is seen in a humble schoolroom in Paris surrounded by poor children, while their parents look on amazed at a distance. M. THIRION shows MOSES exposed on the Nile, and the grief of the mother as the basket of bullrushes floats away from her on the broad water. It also is novel and impressive. M. DAGNAN-BOUVERET in *La Vierge* shows the carpenter's workshop, and here again we see a worthy interpretation of the theme.

The commissions for pictures for public buildings, such as municipal buildings, museums, and churches, give artists opportunities for representing the figure on the largest scale. This year there are several works which, if seen in Burlington House, would be called colossal. One which has apparently obtained the Médaille d'honneur for its author is M. BOUGUEREAU'S diptych *The Adoration of the Magi* and *The Adoration of the Shepherds*, which is intended for the Church of St. Vincent de Paul. It shows the marvellous workmanship of the author. M. BOUGUEREAU paints Scripture pieces or pagan legends, goddesses or madonnas, saints or peasant children with equal facility. Every work is marked by brilliancy, the contours are almost faultless, and yet somehow one is rarely satisfied with the painter. He is so able that more is expected from him. It is difficult to resist the thought that M. BOUGUEREAU is unmoved by his own work, like GUIDO; his facility in producing beautiful forms is almost a dangerous gift, for apparently one class of work is the same to him as another. But it may be safely assumed that M. BOUGUEREAU could not be tempted by a commission for such a painting as M. BONNAT'S *Martyrdom of St. Denis*, which is intended for the Panthéon. The legend of the first bishop of Paris, who took up his head and carried it off after decapitation, hardly seems adapted for painting; but the experiment has to be often made in France. In the Church of La Trinité there is a painting by M. LANGEÉ, if we remember rightly, where the saint is seen clad in his episcopal robes, and carries the head which bears the mitre in his two hands against his breast. But in addition there is an indication of the head in its proper place, which suggests the dotted lines on a plan to express some former part of a building. The arrangement is evidence of the difficulty of the task. M. BONNAT evades it by representing St. DENIS just risen from the block at Montmartre, and stooping to pick up his own head, while the spectators look on with amazement. There is realism enough about the scene, which gives scope for that display of blood in which so many artists have taken delight since it brought fame to poor HENRI REGNAULT. The figures are vigorously painted, and of course there is the skill in expression which belongs to so eminent a portrait painter. But the hatching which is employed to express the muscles diminishes the general effect, while the subject can never be pleasing, even in a building like the Panthéon, where so many legends are represented.

The painting by M. BENJAMIN-CONSTANT, *La Justice du Chérif*, is larger than any work from his hand which we have seen lately. This painter has made the Moors his special study, and has read the old legends with the light derived from travel in the East. The subject of the picture is the vengeance as much as the justice of a prince who has had the women of his harem executed in a chamber that is suggestive of Oriental luxury in its most expensive form. The air of the room is filled with the smoke of incense, the fountain throws up a delicate jet of water, the couches are emblazoned with embroidery, and all this glory enhances the gloom of the scene, for it contrasts with the slain favourites who still wear the richest gems on their necks and fingers. If we might venture to suggest a defect in so splendid a specimen, it is the figures of the two executioners who are squatted near the victims. They are, we think, unnecessary, and their absence would have made the scene more tragic. Another, and a much larger Moorish scene, is M. CLAIRIN'S *After the Victory*. One is an interior, and sombre; the other an exterior, and almost dazzling in light. We see the outside of the Alhambra, and in one of

the gates is the king on his horse. Around are chiefs, who look to him with enthusiasm, and are proud to lay the fruits of their victory at his feet. Along the walls are negroes, who hold banners. In the foreground on one side are the bodies of Christian soldiers, old and young, and on the other are the captive women. A colossal Moor holds a fainting girl in his arms as if she were a baby, while her mother or sister raises herself with difficulty for a final appeal. It is a pageant, and the suffering of the Christians counts for little. Very different is the big picture by M. ROLL, which, as is usual with this artist's works, occupies one of the most important positions in the whole exhibition. It is called *Le Travail*, and represents a building work at Suresne. The figures are larger than life. As M. ROLL never extenuates any defects in the forms of his countrymen, the stone-cutters and labourers are not handsome, and have the look of men who use certain muscles more than others. The atmosphere seems to be filled with stone-dust, and altogether labour appears to be much less attractive here than in the picture which Mr. MADOX BROWN painted of an excavation in a London street, with CARLYLE and MAURICE looking on; or in the picture of the Portland Quarries, by Mr. WELLS, which is in the Royal Academy. But the endeavour to be truthful, regardless of conventions, gives importance to the painting, and it is not surprising that it obtained so many votes in the contest for the medal.

If M. ROLL represents the most advanced realism, we see a no less notable example of idealism in M. FRITEL'S *Solum Patrie*. It is one of the numerous appeals to patriotism in the exhibition. Night has fallen, and a body of ghostly warriors, from ROLAND to the first NAPOLEON, are seen passing over a French field. They are the spirits of the men who were defenders of the country in many ages, and they come with the sad conviction that they cannot die again for it. The power of the work is manifest, but either poetic imagination does not correspond with modern notions, or it was considered impolitic to approve of the subject, for M. FRITEL received but two votes in the competition for the medal of honour. M. MAILLART has sent one of the series of historic pictures which he has in hand for the town of Beauvais. It also is patriotic in spirit, and suggests that a man cannot die better than when facing fearful odds, for the ashes of his fathers and the temples of his deities. The subject is taken from the "Commentaries" of CÆSAR, and represents the death of the Gallic chief CORREUS. He is the last of his tribe, and stands on the field amidst a heap of slain, attended by his faithful dog. Around are the Roman archers, and beyond is the leader with a large army. Life is only a question of a moment, and the moral victory is with the man who looks down on the host that will not venture within arm's length of him. It is an old version of a truth which France has been taught, that superior weapons must win the day against courage. The town of Châteaudun took an honourable part in the last war, which has been symbolised in the admirable work by M. LECHEVALIER CHEVIGNARD, which is intended for the local hôtel de ville. Here we see warriors of various times, whose names are associated with the place, and who recognise the merit of the latest evidence of courageous defence.

The works of M. PUVIS DE CHAVANNES are always of great importance to every one who studies decorative art, although justice can never be done to his works in the Salon, inasmuch as the scheme of colouring is determined by the position which the painting has eventually to hold. This year we have only a small cabinet picture by the artist, *Autumn*, which is another version of a work in Lyons. The subject is simple, and shows two nude girls gathering fruit, while a woman looks on. The beauty of line is undoubted, and the picture attracts in spite of the flatness of treatment, which is unusual in works of the size. As M. HENNER lives in an adjoining appartement to M. PUVIS DE CHAVANNES, the work of one artist suggests the other's. Their styles are alike and yet unlike in many respects. Both are remarkable for the simplicity of their scheme of colour, but M. HENNER always avoids large canvases. Objection has been raised against the similarity in his pictures, and we might apply what Dr. JOHNSON said of green fields, and say, "When you have seen one picture by M. HENNER you have seen all." But it deserves to be remembered that the slightest change in the pose of a

figure makes subtle differences in all the parts, and they are realised by M. HENNER, and almost by him alone. His *Magdalen* may have resemblance to others of his kneeling figures, but it could not be passed over in the largest gallery of the Salon. Yet apparently nothing can be simpler. The flesh is like ivory in colour, the hair is golden, and the robe is deep black. The background is so slightly painted that we can see the grain of the panel. The girl's face is concealed by her hands, but the figure fascinates. In his *Fabiola* we have a head of a girl in profile wearing a black veil. Mr. WHISTLER knows what use can be made of black, but he does not observe the law *rien de trop* so well as M. HENNER, whose works, apparently simple, are inimitable. M. HENNER, perhaps, has hitherto made the nearest approach, but this year he has done more justice to his own originality, and his *Nymphes* is an admirable specimen of flesh-painting.

The landscapes, as we have said, are numerous; mountain scenery alone has failed to afford subjects to the French artists. In sea pieces they are becoming most effective. Such a picture as M. BERTHELEMY'S *Coup de Vent-débout* expresses wave-force in a manner that would have pleased TURNER or STANFIELD. Two remarkable landscapes which have come from the north of Europe should not be passed over in the shortest notice. One is M. SINDING'S *Laplanders Saluting the Sun after the Winter*, which might be labelled as the representation of a scene in prehistoric times, owing to the strange forms of the people, who are gazing across the desolate country. The second is also by a Norwegian artist, M. NORMANN, and gives a view of one of the fiords in a masterly style. The detail of the rocks is shown with a distinctness that seems almost photographic, but there is no loss of breadth in the treatment.

There are a few pictures taken from English history which merit attention. One is M. MAIGNAN'S sombre but able work representing the body of WILLIAM THE CONQUEROR lying naked on the ground, after the attendants had pillaged everything that was left near the corpse. A second is M. PESNELLE'S *Murder of the Princes in the Tower*, which is as excellent in drawing as in colour; and a third is the brilliantly painted figure of ELIZABETH at Woodstock, by M. A. BARZAGHI-CATTANEO. But in recent exhibitions in Paris history pieces are at a discount. M. BRUNET depicts the deliverance of Poitiers from the English. M. LOUIS BEROU has a large work in three panels, representing HENRY III. at Venice, for which inspiration has evidently been taken from the works of VERONESE. It gives good promise for the young artist's future. From what we have said it will, we trust, be evident that the visitor need not anticipate, in spite of the newspapers, that there is any diminution of interest in this year's Salon.

## NOTES ON SOME PROVINCIAL CHURCHES.

[BY A CORRESPONDENT.]

AN architect with a fairly wide country practice has many opportunities in the spare hours which he must necessarily have, while going from one place to another, of examining various buildings. I therefore think that a *resumé* of some of these experiences of ecclesiastical architecture may not prove uninteresting, or, I venture to hope, unprofitable to the readers of *The Architect*. If I occasionally somewhat enlarge on what I take as my "text," it is because I see a favourable opportunity of expressing views by no means foreign to the point at issue.

The parish church of Frome, though it has been practically almost rebuilt, is yet very interesting, owing to several remarkable features. Its situation, on a hill, is picturesque, and has lent itself under skilful hands to the best use. I think there could not be a better beginning of the approach to the church than the fountain, with its clear rill of sparkling water, a sight which moreover suggests symbolic references. The fountain is fortunately not like a mere squirt, but is an arched recess in the retaining wall of the path. Why cannot such a charming treatment as this be adopted in other instances where a hillside gives the opportunity, as, for example, at a church like St. Mary's, Whitby? The winding of the path and steps up to the porch was cleverly arranged by the late Mr. GILES, the well-

known architect. Observe how, in one sculptured scene, half of the subject is on one side of an inner angle, the remainder on the other side.

Entering the church, the systematic manner in which the designs of the painted glass windows are arranged is much to be commended. The patron saint being St. JOHN BAPTIST, his life is depicted, each window having under it a brass tablet recording the cause of its erection. The Chapel of St. Nicholas is now used as a baptistery, the screen appropriately representing water-lilies and fish. The pavement, where most distant from the font, is composed of various inlaid coloured marbles, and exhibits the Seven Deadly Sins, while nearer the font are represented the Seven Virtues. The panelling of the wall, we are told, represents the net which the fishers—*i.e.* Apostles—were to throw into the sea and catch of the fish both good and bad. I cannot help considering the water-lilies and fish as well as the net as rather far-fetched symbolism to represent decoratively—in fact, a little childish for our modern ideas, and giving occasion for ridicule on a solemn subject. The same kind of symbolism occurs in the west apsidal baptistery of St. Barnabas, Oxford. The window to the baptistery at Frome is a representation combining a memorial of St. NICHOLAS and the apostolic commission of baptism. After figures of the Apostles, St. NICHOLAS, as Bishop of Myra, in his cope, and with mitre and crozier, is shown as a kneeling figure receiving by succession the apostolic commission. Over the chancel arch is represented the Adoration of the Lamb, before whom the angels and the saints are casting down their crowns. The sculptured stone medallions on the north side of the nave contain the Miracles of our LORD, the south side the Parables, and constitute a very interesting series. At the Church of St. Mary Magdalene, Paddington, a similar treatment has been adopted with good effect. The pulpit is surrounded by sculptures of eight of the principal preachers of the world:—NOAH, MOSES, ELIJAH, St. JOHN BAPTIST, St. PETER, St. PAUL, St. CHRYSOSTOM, and St. AMBROSE. Turning to the reredos, the history there represented is carried on in point of time by the painted glass window above.

In the fine church of All Saints, Clifton, the architect did not forget that churches are made for use—*i.e.* for worshippers—and, instead of allowing the west entrance to be cold and draughty, as is too often the case, he provided a large internal oak lobby of appropriate design. On weekdays about half the western area of the nave is cleared of chairs, which are all piled up one side, as likewise the kneeling cushions. For the greater facility of shifting about the latter there is a Gothic wheelbarrow. The appearance of the large unencumbered area near the principal entrance is pleasing. The font is rightly dignified by being raised on a large square platform, the tile pavement around it being richer in design than in the rest of the nave. The effect of the colouring on the deal boarding to the nave roof, without staining or varnishing, leaving the natural surface, is good; but the same cannot be said—at any rate, by most people—of the colouring to the sculpture of the splendid reredos. The propriety of tinting sculpture is too much of a vexed question to enlarge upon here, and would require an article by itself. The subjects of all the painted glass windows have been mapped out, so that the whole forms one continuous well-considered scheme. One of the notable features in this striking church is the noble chancel screen, which could not escape the observation, or, it is to be hoped, the admiration of the most casual spectator. In Mediæval times in England, as far as I am aware, there are no examples of metal rood screens, though they are to be found on the Continent. Examples of wrought-iron grilles to chantry chapels are not infrequent. The use of iron and brass for this purpose is one of those bold departures from ancient English precedent for which we have to thank some of those great pioneers of the revived Mediæval styles. The material has its advantages in the capacity of being made rich and yet light, so no one can say that view or sound is obstructed, though some may declare that the clergy and choir look as if enclosed in a bird-cage. It is very easy to raise a senseless laugh. Modern wood rood screens can have the mullions and openings of greater width than old examples, and the tracery above the sight line as rich as may be desired. Yet the effect cannot be so good, or furnish the interior of a church so well, as the more

frequent mullions and narrow panels. At All Saints, as has been implied, the chancel screen is composed of brass and wrought iron, the gates having closer and more elaborate work than the sides, which are more open. Much is often said in our times as to the appropriate treatment of wood, stone, and metal respectively. Do we, as a general rule, see this in Mediæval work of the best periods? For example: in the beautiful old altar screens the stonework is fully as delicately moulded and carved—in fact, marvellously so, as if it was of metal or wood. I do not say this is a reason why we should not act up to the common sense principles we have formulated; but I think it is a reason why our hobby-horse should not be ridden too hard.

The chapel at Eton College is an example which, externally, in its height and general scale, looks Continental, though internally it is quite English in type. Its grandly-proportioned and rich windows, of the best period of the Perpendicular style, have also excellent tracery and mouldings. They fill up nearly the whole space between the buttresses, some of the outer mouldings stopping against them, which is also more of a foreign than an English feature. The same remark applies to the great height from the floor at which the windows are placed, which leaves such a large unbroken space of wall beneath them. The buttresses are a striking feature in this chapel, being unusually large and bold.

How are return-stalls to be rendered applicable to English churches at the present day? The question was drawn forth by the examination of St. Clement's Church, Bournemouth, for which the architect has recently designed a fine reredos. Without commenting on any other details of this building, I give the note I made immediately after my examination of the structure. "One of the best things in this church is the arrangement of the return-stalls, placed at an angle of forty-five degrees, instead of with their backs to the congregation." In my MS. relating to this subject, a page or two further on, this passage occurs about the interesting Mediæval church of Adisham, Kent:—"There are two return-stalls on the east side of the rood screen. Now, however virtually correct this may be, a not unnatural prejudice exists against seeing only the clergyman's back during nearly the whole service. Moreover, if he has a weak voice, it is almost impossible to hear him. In these times it seems to me we should only adopt those Mediæval customs that harmonise with the feelings of the present day, and not merely introduce practices because they are Mediæval or modern Roman." But when an architect is restoring an ancient church where the original "return"-stalls remain, however imperfect, he should certainly preserve the arrangement. It is not necessary to use them, and they do no harm, obstruct no view, and are always there to show their history. Continuing my notice of Adisham Church, I should remark that in the chancel a Mediæval tile pavement exists. The pattern is rather a large one for a small church, as it is formed of sixteen tiles, each about 4 inches square. Every tile is, however, complete in itself as regards its own device. Had the tiles been 6 inches square, the arrangement would certainly have been too large in scale except for a big church, and the discrimination of the designer is thus shown. Another feature in the same building worth commenting on is the arrangement of the organ, which, when I saw it some years since, stood in the chancel, the organ on one side, the keyboard on the other, the trackers being under the floor. The keyboard has the semblance of a large, high, and wide reading-desk ornamentally treated. There is plenty of space for the organist, though the necessary mechanism must have been rather costly. The church is of cruciform plan, but the architect has done wisely in not placing the organ in one of the transepts away from its work. Instead of a reredos is a triptych, a feature becoming not so uncommon in the present day.

I have before this commented in these pages on the charming new parish church of Bettws-y-coed. So I would now confine myself to remarking on the effective manner in which the tile pavement to the chancel is treated. There is nothing "fussy" about it, nothing but what is appropriate to a village church. The idea intended to be suggested is evidently that of a processional path, like a broad piece of carpet leading quite up to the altar; the pattern is confined

to this part, the sides being quite plain. It is best in such cases to have plenty of red tiles, a very safe colour when employed in any quantity, as it never seems to unduly predominate or attract too much attention. With a few patterns here and there it is quite ornamental enough for the normal rural church. A good modern book of suggested arrangements of tiles, originated by some able architect, is a desideratum. Some of those in MAW's pattern-book, designed by eminent architects, are good; but many aim too high, and have too much variety of pattern and colour for ordinary use. In the Mediæval marble *opus Alexandrinum* pavements of Italy the tints are less crude, and there is an absence of the objectionable chess-board appearance so often observable in tile arrangements.

At Warmington Church, Northamptonshire, which has been well illustrated by Mr. WM. CAVELER, 1850, it should be observed in what a charming manner the plan of the jambs to the south aisle windows is changed at the springing line of the arches by the miniature capitals to the shafts. One cannot judge of the effect of such little refinements of architecture by drawings—one must see them. In a church of larger scale, and with larger windows, a loss of dignity might have arisen through such features. The eye seems then to require a more stately treatment. What is to be commended, and perhaps called picturesque in a small building, may become the reverse in a larger one, when a certain amount of repetition is necessary to avoid a bizarre appearance. It may seem a paradox, but the larger the structure, the less variety ought there to be proportionately in the detail, by which means greater dignity and stateliness is obtained. As a question of restoring an old parish church for the uses of the present day, I cannot but consider that Sir GILBERT SCOTT made a mistake in imitating the interesting Mediæval but very uncomfortable, low, and straight-backed benches at Warmington Church. Only a very few of them remained. It therefore seems a pity that, when entirely reseating a church, he reproduced the old ones, disregarding modern and altered requirements. The lower panels of the rood screen contain specimens of the ancient colouring. When those singing in the choir sit down these panels are so high as to entirely hide them. Here is, indeed, a conflict between archæology and modern ritual, and it is difficult to know how to act for the best in such cases, for in many old churches the unpierced lower portion of the rood screen is very high.

## THE ARCHITECTURAL ASSOCIATION.

A SPECIAL business meeting was held on Friday evening the 29th ult., Mr. R. C. Pink, president, in the chair.

The following gentlemen were elected members:—Messrs. B. Pethick, P. J. Dawson, J. C. T. Murray, E. G. Braybrook, and E. C. Bateman.

A vote of thanks was awarded to Messrs. Manning & Baynes, engineers, and Mr. Gruning, architect, in connection with the visit to Tilbury Dock; also to Messrs. Perry for kindly providing luncheon.

The PRESIDENT said the next business was the consideration of a report of the Committee upon a scheme for amending and consolidating the work of the Association.

Mr. Gotch proposed the adoption of the report. This was seconded by Mr. Slater.

The clauses were then taken *seriatim*, and the report in its amended form passed as follows:—

1. That there shall be two defined divisions of study in the Architectural Association, to be called the "Elementary Division" and the "Advanced Division."

2. That a chart, as here given, be drawn up, explanatory of this principle for the use of students and others.

### CHART.

|   |  |  |
|---|--|--|
| Sec. I.—El. Class of Design<br>Sec. II.—<br>See pages | El. Class of Construction<br>See pages           | Lectures on History and Construction<br>See pages  |
| Class of Design<br>" Colour Decoration<br>See pages   | Class of Construction<br>Advanced "<br>See pages | Class for Quantity-Taking and Specification-Writing<br>Class for Land-Surveying<br>See pages |

3. That a committee of advice, whose names shall be published in the Brown Book, be appointed by the committee each session, whose duty it shall be to recommend to members

on application the particular course of study it would be advisable for them to pursue in the Architectural Association.

4. That a circular be published containing general suggestions, the chart, &c., for the guidance of students and others, and the same be also included in the information afforded by the Brown Book.

5. That there shall be a committee of visitors appointed each session to all the classes, to conduct the work of the same. The visitors to be *ex-officio* members of the committee of advice.

6. That the classes be arranged in the following order, viz.:—

7. Elementary Class of Design.—Section I. For study of ancient examples. Section II. For design based upon ancient examples.

8. Elementary Class of Construction.—The subjects to be treated in a more elementary manner than has hitherto been adopted, but on the same principle.

9. Lectures on the History of Architecture.—Lectures on Construction.—That the principle of *viva voce* questioning be adopted at the lectures, and the subjects treated of, to work in conjunction (as far as possible) with those set down in the classes.

10. Class of Design.—Conducted on the same lines as at present.

11. Class for the Study of Colour Decoration.—Conducted on the same lines as at present.

12. Class of Construction and Practice.—Conducted on the same lines as at present.

13. Advanced Class of Construction and Practice.—Conducted on the same lines as at present.

14. Class for the Study of Quantity-taking and Specification-writing.—That a new class be formed, and that planning, which has hitherto been taken conjointly with specification-writing, be now omitted from this class, and embraced in the work of the class of design.

14a. Surveying class to be conducted on the same lines as at present.

15. That members of the elementary classes be eligible to compete for prizes in their class during their first and second sessions only; but not after having attained the age of twenty-three years after the last meeting of the session.

16. That the rule as to members contributing to the work of the classes in future be strictly observed. That the amount of work in the various classes be reduced.

17. That in awarding marks in the classes of design, greater stress be laid in future on the quality of the draughtsmanship.

18. That the session shall commence on the first Friday in October and finish by the end of April or beginning of May.

19. [That country members be invited to send to the honorary secretaries their views (not later than May 20) stating how they consider the advantages of the Architectural Association may best be extended to them. All members are requested to express their views on this important subject.]

20. That the Essay Prize be of the value of 5*l.* 5*s.*, and be accompanied by the presentation of a silver medal; that the Architectural Association Design Prize be of the value of 10*l.* 10*s.*, and be accompanied by a silver medal.

21. That under necessary regulations arrangements be made for the inspection of buildings in progress by individual members during working hours, and also to practical workshops, and if means are forthcoming to provide technical and experimental instruction.

22. That after the year 1886 candidates for the Travelling Studentship be required to show that they have passed satisfactorily through one or more of the classes, except in the case of country members, which shall be referred over to the Committee. That the names of the holders of the Studentship be published in the Brown Book, and that the sketch of each student, which by the existing condition of the competition becomes the property of the Architectural Association, be framed with the name of the student and date of his year, and hung in the rooms of the Architectural Association.

23. That it is desirable that the library accommodation be extended and be opened to students two evenings in the week, and a general meeting-room be attached where the professional journals, &c., can be seen and tea and coffee obtained at a fixed tariff.

24. That the distribution of prizes and delivery of addresses be in future omitted at the *conversazione*.

25. That at the annual general meeting the prizes shall be distributed, the President shall deliver his address (as heretofore), and that short addresses be invited from the senior members of the profession.

26. That the following alterations be made in the Rules:—Rule 3, on sixth line, after "classes" to insert "and lectures."

Rule 38, on third line, after the words "shall be" to omit those to the end and substitute "placed at the disposal of the members, the prizes shall be distributed, the President shall deliver an address, and short addresses be also invited from senior members of the profession."

Rule 40, on second line, after the word "session" to omit the words to the end of Rule.

Rule 41, on second line, to substitute "May" for "June."

In discussing the subject most of the clauses were adopted without a dissentient opinion being expressed; in other cases the alterations involved no particulars of importance, whereas a brisk discussion took place on others. In regard of clause 5, Mr. J. D. Mathews regretted that there should be any idea of taking visitors from outside the Association, which had hitherto always been self-contained. He thought there were gentlemen in the Association sufficiently qualified for the purpose. Mr. Cole Adams remarked that it was proposed to have secretaries of the classes instead of presidents.

In regard of clause 14, it was pointed out by Mr. Cole A. Adams that the proposed establishment of this class had been received favourably, and he said that those who did not elect to take out their own quantities ought at any rate to know how to do so, and that by thus dissecting a building they got a proper grasp of the construction, such as they could not get in other ways. Lithographed sheets would be handed round and explained by the conductor of the class. Some members contended that this would interfere with properly learning specification writing, and that for architects precedence should be given to specification writing. On the other hand, it was urged that an architect learnt specification writing best by being taught to take out quantities. Mr. H. W. Pratt proposed, and Mr. Morgan seconded, as an amendment that in the title of the class "Specification Writing" should precede "Quantity Taking." This was lost on a show of hands and the clause adopted in its integrity. Clause 14A, omitted by inadvertence, was inserted.

Clause 15 originally ran, "That no member of the elementary classes be eligible to compete for prizes of his class after he has attended two sessions in that class." A discussion ensued in regard of the limit of age, as to whether it should be fixed at 23, 24, or 25 years of age, and by a large majority 23 years was fixed on.

A debate next took place on clause 16, as to enforcing the strict rule. Several amendments were put and lost. It was urged that the conductor of the class should have discretionary power; that members sometimes would, through no fault of their own, be excluded from the class. They might have been ill or detained in the office very late. The imposition of fines was proposed along with other suggestions, also by Mr. Slater, considering the difficulties that surrounded the matter, that the clause should be expunged. Statistics, however, were quoted to show that there were ample reasons why the attention of members should be called to the strict observance of the rule. In considering clause 20, Mr. Aston Webb pointed out that the A. A. design prize was *par excellence* the prize of the Association, but other prizes had gone over its head. He proposed that in value it should be raised to ten guineas, and accompanied by a silver medal. In opposition to this it was said that the worth of the prize was not in its money value but rather in *kudos*. A member added that he believed the rules conferred on the committee the power to arrange prize matters. The proposal of Mr. Webb was, however, put to the meeting, and very naturally was carried. An addendum was made to clause 22 in regard of country members. Amendments were proposed to clauses 24, 25, and 26, but lost, and eventually the main portion of the report, as amended, was adopted.

The printed circular containing the report went on to say that "the Committee have had under their consideration the report of the sub-committee appointed to consider the question of publishing the papers read at the general meetings, and they are of opinion that as this opens up the wide question of increased subscription from the members, that the decision as to its advisability should be left with the members themselves to decide," and members were required to state their views on the matter not later than May 20, so that a decision might be come to at the special meeting on May 29, when Mr. Cole A. Adams would move that in Rule 18 "17. 1s." should be substituted for "10s. 6d." with the object of affording means for increased educational advantages, &c.

Mr. COLE A. ADAMS made this motion. It was, he said, absolutely necessary to meet the new conditions of work, and was but a slight outlay for increased advantages which were requisite if they would keep touch with the times. In reply to the circulars sent out, only one in ten had been answered. Sixty answers more or less in favour had been received, and forty answers were dissentient.

Mr. ASTON WEBB said the proposed change was one of solute necessity.

Mr. MATHEWS opposed it. With the experience of twenty years as hon. treasurer, he was able to say that there had never been any difficulty in meeting expenses, and he feared if the subscriptions were raised many of the elder members would withdraw from the Association.

Mr. M. B. ADAMS said that if the subscriptions were raised he believed a half-guinea society would at once be started, as

there were plenty of embryo officials ready to distinguish themselves.

An animated debate was continued till a late hour. At length, on the proposition of Mr. Stannus, seconded by Mr. Baggallay, it was adjourned for a fortnight. It was past eleven o'clock when the proceedings were brought to a close.

## TESSERÆ.

### Unique Position of Architecture.

SIR FRANCIS PALGRAVE.

WE want a term to designate the intellectual rank of architecture, so closely connected with the imagination that we can scarcely term it a science, so entirely practical and subservient to our needs that we can scarcely reckon it as one of the æsthetic arts. And yet the arts must all be coerced into the architect's service. Architecture, as a branch of human wisdom, constitutes a genius of its own. Sculpture and painting are entirely founded upon the imitation of nature, whereas the basis of architecture is utility—utility in every sense, from the lowest to the highest—while it is wholly conventional in outward arrangements and forms. Architecture may borrow many a principle from nature, but she consults nature for lessons and not for models.

### Subordination in Landscape.

DAVID COX.

The student should ever keep in view the principal object which induced him to make the sketch, whether it be mountain, castle, group of trees, cornfield, river scene, or any other object. The prominence of this leading feature in the piece should be duly supported throughout, the character of the picture derived from it and every other object introduced subordinate to it, and the attraction of the one should be the attraction of the whole. All the lights of a picture should be composed of warm tints, and every tint laid on with clearness and precision.

### The Departmental Art Schools.

J. C. L. SPARKES.

To show that the schools have been most useful in the higher branches of art, it will perhaps be sufficient to mention the names of W. C. T. Dobson, R.A. (Somerset House); E. J. Poynter, R.A. (Somerset House); H. H. Armstead, R.A. (Somerset House); W. W. Oulless, R.A. (Lambeth); H. Herkomer, A.R.A. (Southampton); E. J. Gregory, A.R.A. (Southampton); Luke Fildes, A.R.A. (Chester); H. Woods, A.R.A. (Warrington); Mrs. Butler (South Kensington); Mrs. Allingham, J. D. Watson, C. E. Johnson, Clarence Whaite, S. Sidley, Edwin Bale, Wilmot Pilbury, J. Parker, C. P. and F. A. Slocombe, H. A. Gribble, and others, all of whom in the earlier stages of their career were under instruction in the schools of art. To enumerate all the ex-students who have attained honourable distinction would be altogether impracticable, but it may be stated that they also include the late Godfrey Sykes, one of the most admirable decorative artists the schools have produced; George Tinworth, the development of whose singular gifts as a sculptor of Biblical subjects is a lasting honour to the Lambeth School; Leonard Wyon and George Morgan, the latter of whom fills a position at Philadelphia similar to that which the former occupies in England; F. W. Moody, to whose skill and fancy much of the decorative work at the South Kensington Museum is attributable; Hugh Stannus, who was appointed to complete the Wellington monument after the death of Mr. Stevens, and is now engaged in working out experimentally a modification of that artist's design for the decoration of the cupola of St. Paul's Cathedral; and a host of other exponents of English art. Indeed, the work of the schools, while earnestly and persistently directed to its primary object—the improvement of our manufactures—is well engaged in the incidental encouragement of any kind of artistic talent, and it would not be wise to place too tight a rein on the direction it may be disposed to take.

### Encaustic Tiles.

L. ARNOUX.

The process used in making the tesserae and plain tiles is very simple. After the clays have been prepared and mixed in the regular way, they are dried and reduced to a fine powder. This material being placed in metallic moulds, receives by a screw such a pressure that it becomes perfectly hard, and may be handled and otherwise treated in the same manner as those produced by the old process. The chief advantages of this new process are, independently of its quickness, the avoidance of contraction and of a change of surfaces, the mechanical pressure placing the particles in closer contact, and suppressing in great part the contraction they are subject to in the plastic

state, whilst drying or firing. This contraction, which in the latter case may be from one-eighth to one-twelfth, is reduced by the new process to less than one-twentieth. The surfaces are also smoother, and the straightness of the sides perfect. With regard to encaustic pavements inlaid with coloured design, although machinery is used to impress the design and to shape the tiles, yet they are worked in the plastic state. When the press has stamped the design on the tile it appears slightly depressed, and the indentation is then filled with clays of different colours in liquid state. Afterwards, the whole being sufficiently hardened, the workman, with a flat steel, scrapes the surface till the design appears perfectly clear and correct. This process is the same which was used to a certain extent in the Middle Ages in France and England for pavements in churches, and also in the sixteenth century for making the beautiful pottery known as "Henry the Second ware."

#### Flexure of Columns.

EATON HODGKINSON.

It appeared from the researches of the great analyst Euler that a pillar of any given dimensions and description of material required a certain weight to bend it, even in the slightest degree; and with less than this weight it would not be bent at all (Acad. de Berlin, 1757). Lagrange, in an elaborate essay in the same work, arrives at the same conclusion. The theory, as deduced from this conclusion, is very beautiful, and Poisson's exposition of it in his "Mécanique," 2nd edition, vol. i., will well repay the labour of a perusal. I have many times sought experimentally with great care for the weight-producing incipient flexure, according to the theory of Euler, but have hitherto been unsuccessful. So far as I can see, flexure commences with weights far below those with which pillars are usually loaded in practice. It seems to be produced by weights much smaller than are sufficient to render it capable of being measured. I am, therefore, doubtful whether such a fixed point will ever be obtained, if indeed it exist. With respect to the conclusions of some writers, that flexure does not take place with less than about half the break-weight, this, I conceive, could only mean large and palpable flexure, and it is not improbable that the writers were in some degree deceived from their having generally used specimens thicker, compared with their length, than have been usually employed in the present effort.

#### Thickness of Ancient Arches.

JOSEPH GWILT.

Of the thickness given to the voussoirs at the crown there have been many differing examples: in general, we may put it down from one-fourteenth to one-seventeenth of the span of the arch, varying according to particular circumstances. Palladio gives the thickness of them in the ancient bridge at Rimini at one-tenth of the span to the middle arch, and one-eighth to the side arches. Again, in the bridge at Vicenza, he gives the voussoirs to the middle arch one-twelfth of the span, and the side arches one-ninth. But in a design by himself he makes the thickness of the voussoirs in the middle arch one-seventeenth, and that of those of the side arches one-fourteenth of the span. L. B. Alberti recommends them to be of the largest and hardest stones, and directs no stone to be used that is not at least one-tenth of the chord of the arch; nor (says Alberti) should the chord itself be longer than six times the thickness of the pier, nor shorter than four times.

#### The Scottish Mason.

HUGH MILLER.

The professional character of the mason varies a good deal in the several provinces of Scotland, according to the various circumstances in which he is placed. He is in general a blunt, manly, taciturn fellow, who, without much of the Radical or Chartist about him, especially if wages be good and employment abundant, rarely touches his hat to a gentleman. His employment is less purely mechanical than many others; he is not like a man ceaselessly engaged in pointing needles or fashioning pin-heads. On the contrary, every stone he lays or hews demands the exercise of a certain amount of judgment for itself, and so cannot wholly suffer his mind to fall asleep over his work. When engaged, too, in erecting some fine building, he always experiences a degree of interest in marking the effect of the design developing itself piecemeal and growing up under his hands, and so he rarely wearies of what he is doing. Further, his profession has this advantage—that it educates his sense of sight. Accustomed to ascertain the straightness of lines at a glance, and to cast his eye along plane walls or the mouldings of entablatures or architraves in order to determine the rectitude of the masonry, he acquires a sort of mathematical precision in determining the true bearings and position of objects, and is usually found when admitted into a rifle club to equal, without previous practice, its second-rate shots. He only falls short of his first-rate ones because, uninitiated by the experience of his profession in the mystery of the parabolic curve, he fails, in taking aim, to make the proper

allowance for it. The mason is almost always a silent man: the strain of his respiration is too great when he is actively employed to leave the necessary freedom to the organs of speech, and so at least the provincial builder or stone-cutter rarely or never becomes a democratic orator. I have met with exceptional cases in the larger towns, but they were the result of individual idiosyncrasies developed in clubs and taverns, and were not professional.

#### Defective Masonry.

EDWIN NASH.

There is abundant evidence in both ancient and modern work, of the defective mode in which the materials of walls are put together, and though this may be of comparatively slight importance when the walls have not much duty beyond that of being enclosures of buildings, yet when they have to sustain great weights or thrusts, it becomes of paramount importance that their materials be well applied and united, and this fact seems scarcely to have been fully appreciated since the best days of the Greeks and Romans. The cracking of the piers carrying the dome of the Panthéon at Paris is a most instructive warning under this head, but the chief defect that I wish to allude to is the absence of that uniformity in the horizontal strata of the walls which the word "homogeneous" most expressively indicates, and of which defect the tambour wall under the dome of St. Peter at Rome is a notable example. In a rapid age like the present it is not likely that this homogeneity or similarity of material through the whole thickness of the wall will be thoroughly attended to. In buildings even of considerable excellence the water-tables of buttresses often break away from the body of the buttress, especially when the bulk of the work is of rough stone. This irregular settlement shows that the dressed stone, being more completely laid than the rough stone, the two do not harmoniously blend, and that a more thorough bonding is needful by using longer alternate stones than is customary, and it also suggests the idea that the buttresses may have too great a projection, inasmuch as the outer part may not catch the due influence of the weight.

#### Henri Deux Ware.

J. C. ROBINSON, F.S.A.

The pottery known as "Faïence de Henri Deux," or of "Diane de Poitiers," or "Henri Deux ware," is a very remarkable and original variety of earthenware, produced somewhere in France during the later years of Francis the First's reign and the reign of Henri Deux. Although it has excited the keenest interest and curiosity amongst amateurs and collectors, and, in consequence, the pecuniary value of the specimens has attained to a fabulous ratio—very far, indeed, beyond that of any other variety of decorative pottery—nothing is known with certainty respecting either the producer or the place of its origin. With the exception of certain indications of the ownership of some of the pieces, evidenced by armorial bearings and initials, everything respecting this ware is still shrouded in mystery. Its great pecuniary value has arisen from several causes, but especially from its intrinsic artistic merit, for it cannot be denied that the style of design is singularly original and beautiful. Whilst displaying great variety in their forms and decorative details, the pieces are all conceived in the same characteristic general style, which, though strongly and unmistakably national, and even typical of a well-known and brilliant epoch, is also in the highest degree both personal and local. In fact, there can be little doubt that, as in the case of Palissy ware, this famous pottery was the work or invention of one individual artist, whose labours were evidently anterior to those of the famous *artiste en terre*. This ware is, moreover, scarcely less remarkable from a technical point of view. Its fabrication displays novelties of a singularly interesting nature. Every circumstance, indeed, denotes that the producer was an original genius—one of those representative men who arise only at rare intervals in the province of art, as, indeed, in any other sphere.

#### Watertight Sewers.

SIR R. RAWLINSON, C.E.

Portland cement concrete and mortar may be so used in main-sewer construction as to form a sewer which shall be watertight, retaining sewage and excluding subsoil water. Within the excavated trench form with concrete a bed for the brickwork. Float this bed of concrete over with a layer of Portland cement mortar not less than 1 inch in thickness. Set the invert and side-wall bricks in a single ring of 4½ inches, and then give this a covering of mortar similar to the first bed over the concrete, and set the inner 4½ inches of brick upon it; the work will then be 11 inches in thickness—9 inches of bricks, 2 inches the two beds of mortar. The upper portion of the sewer to be constructed in a similar manner if the subsoil water is liable to rise above the top of the sewer. Brick sewers carefully constructed in the manner indicated will be watertight.

## NOTES AND COMMENTS.

SPECIAL facilities have been granted from time to time to the Science and Art Department, through the well-known courtesy of Pope LEO XIII., for taking copies, &c., of valuable art works at the Vatican. In 1883 a mould was taken of the *Venus* of CNIDUS, and since then copies were made of RAPHAEL'S designs as they appear in the tapestries. Permission has now been obtained for taking a model of PINTURICCHIO'S decorations for ALEXANDER VI.'s rooms, which are not often seen by the general public. The decorations include frescoes and modelled work in stucco, painted and gilded, covering the spaces in the vaulted roofs between the pictures.

THE Municipal Council of Paris have shown their respect for the late M. BALLU by decreeing that his bust is to be placed in the new Hôtel de Ville. M. BALLU was one of the architects of the building, his associate being M. DEPERTHES, and the planning is equally creditable with the exterior appearance to their skill. A stranger can always find his way to any one of the numerous offices without difficulty, and such a thing as a dark corridor is unknown.

ONE of the artistic developments of the times—little short, indeed, of a revolution—is certainly that one which owes so much to the enterprise of Messrs. DOULTON & Co., of the Art Potteries, Lambeth. It is with pleasure, therefore, we are able to announce that the Council of the Society of Arts have (with the approval of the president, H.R.H. the Prince of WALES) awarded the Albert Medal to HENRY DOULTON, “in recognition of the impulse given by him to artistic pottery in this country.” The influence of art in one craft must tend to raise the standard of excellence beyond the limits of its own craft, and it will be acknowledged that Messrs. DOULTON have done even more in art matters than simply to stimulate the production of beautiful samples of the potter's art.

IT would be an interesting problem for a statistician to discover the cost of the wreaths and coronals which were borne in VICTOR HUGO'S funeral on Monday, and of which the majority are now fading on the steps of the Panthéon. The origin of all the flowers would also be worth knowing. One house alone in Paris received over 1,000*l.* for floral memorials. A thousand francs was a common price. That price was paid by the representatives of the Ecole des Beaux-Arts, the Porte St.-Martin Theatre, the Greek students, the Republic of Haïti, the Society of Dramatic Authors, the Lycée Fénelon, and by individual admirers. A higher sum was given by the Press Syndicate. The good taste of the French was shown in the arrangement, and it was difficult to see any which were not harmonious in colour. The English wreaths were less costly. Lord TENNYSON and Mr. BROWNING sent two, but it would not be safe for the French people to suppose that the remaining contributors from England were equally distinguished. The Arts Club, the Athenæum Club, the British Museum, the two rival Academies of Music, Worcester College, and the Institute of Painters in Water-Colours were among those represented in the floral display.

AN appeal has been issued for funds for the proposed restoration of the parish church of St. Mary, Combs, one of the most ancient and interesting churches in Suffolk. The Committee say “this ancient church suffered greatly in 1871 by the explosion of gun-cotton at Stowmarket, by which many of the windows then remaining were destroyed. We have, however, many fragments of beautiful old stained glass, which might be made up and restored. The roof of the south aisle is in a deplorable condition, and must be renewed; indeed, the whole roof requires much repair. The old flint-built walls have been defaced here and there by insertions of modern brick masonry; these should be removed and replaced by flint-masonry. The splendid tower is in a sad state, and the bells also in a deplorable state. One is cracked and upset, two are rung by ropes fastened to the clappers, and the remaining one can only be chimed. The church contains a number of ancient carved oak benches, and two screens. The benches are

disfigured by deal planks fastened on them to form pews, and there are besides pews of varied forms, colours and height, erected in times past to suit the taste of their occupiers. These pews must all be removed, and the benches restored to their old form and character. The parishioners wish to restore their church, not to make it a new one; and all the ancient seats, screens, windows, &c., will be carefully preserved. Mr. HERBERT J. GREEN, of Norwich, has been appointed architect, and has made estimates and plans for the restoration. For a partial restoration the lowest estimate is 900*l.*; for a thorough one, 3,500*l.* Combs is a large scattered agricultural parish, with few church people of any means, and it is hopeless to expect to raise more than a third of the lower sum in the parish and neighbourhood.”

THE late GUSTAVE DORÉ was a native of Alsace, and it is needless to say that the fate of his province was a source of grief to him. Among his bequests was one of 45,375 frs. to the Société de Protection des Alsatiens-Lorrains, which is to be applied to the founding of four bourses and partly towards the completion of the orphanage. An exhibition is now open in one of the *salles* of the Louvre in order to raise funds to support the society, which has expended 3,310,112 frs. since it was formed. Among the means adopted is the establishment of colonists in Algeria, and the settlements are said to be entirely prosperous.

THE eighth annual meeting of the Society for the Protection of Ancient Buildings took place on Thursday in the large room of the Society of Arts, Mr. WILLIAM MORRIS presiding. In the course of the proceedings the Rev. T. W. NORWOOD, F.G.S., read a paper entitled “A plea for the protection of ancient buildings for the sake of history, art, and religion.”

WITH reference to the statement that Mr. MILLAIS'S largest picture at the Academy, *The Ruling Passion*, was destined for the Sydney National Gallery, the honorary purchasers for the National Art Gallery of New South Wales write to the *Daily News*:—“It is possible that some prosperous colonist may have bought the picture with a view to its presentation to the National Art Gallery of New South Wales; but you would oblige by according us the permission to state that it has not been purchased by the responsible authorities of that Gallery, nor has the doing so been at any time under discussion.” The rumour referred to may have been erroneously based upon the fact that Mr. MILLAIS'S *Captive* has been acquired for the Sydney Gallery. It will probably leave the custody of the Fine Art Society, for whom it has been very successfully engraved, in the course of a week or so.

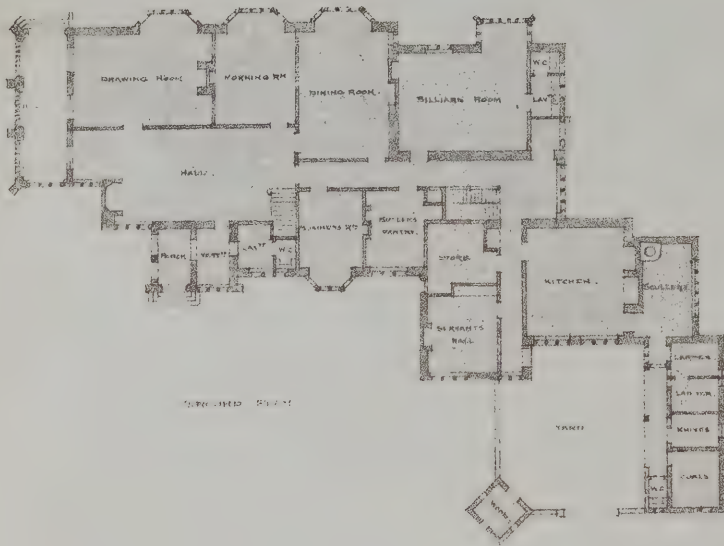

IN the list of French painters the name of ARMAND LELEUX is to be seen, but it is long since he exhibited. A few days ago he died in Paris. He was one of the pupils of INGRES, and more than forty years ago he was known by his pictures of interiors of workshops, forges, and the like. In 1844 he obtained a third-class medal. Soon afterwards he was sent on a mission to Madrid, and on his return he depicted many Spanish scenes. In 1859 he obtained a first-class medal.

EXPLORATIONS of the ruins of Roche Abbey, which forms part of the Scarborough estate, are still being pursued. The unearthing of a large quantity of pieces of coloured glass, supposed to have been parts of the large chancel window, has already been recorded. These pieces, together with a white glass cross, have been made into a window. The cross forms the centre of the window, and is approached by a number of small steps formed in glass. The border is made of various colours, and is of irregular pattern. The window has since been fixed in the lobby of the chapel at Sandbeck. Through the advice of Mr. W. ST. JOHN HOPE, of Derby, who visited the abbey at Easter, the base of the dining-room of the monastery has been discovered. This was found only a few inches below the surface adjoining the chapter-house. Several parts of the interior in both the north and the south chapels have been restored. Three of the large columns of the nave are exposed to view, and altogether the explorations are of a highly-interesting character.

## ILLUSTRATIONS.

WOOLPITS, SURREY.

WE have much pleasure in illustrating this week several designs, at present exhibited in the Royal Academy, by Messrs. ERNEST GEORGE & PETO, of 18 Maddox Street W.

This picturesque house is about to be commenced for Mr. HENRY DOULTON, on the beautiful slopes just below Ewhurst Mill, in Surrey. On entering the house there is a fine hall, 34 feet by 17 feet, with an oak staircase arcaded at one end, the window at the other end of the hall opening into a loggia, which commands the best point of the fine view which is obtained from the house. Along the south side of the hall are arranged the drawing-room, morning-room, dining-room, and billiard-room, also commanding extensive views. The hall is panelled with oak up to the top of doors, while panellings of other woods are used for the various rooms. The billiard-room internally is to be lined with Doulton ware throughout, of a warm and suitable colouring. Several of the ground-floor rooms and hall have beamed ceilings, and the house generally is finished in a perfect manner. Externally, the house will be built with special made thin red bricks, and all the dressings and mullions will be of buff terra-cotta, supplied by Messrs. DOULTON. The roofs will be covered with Horsham stone slabs. The whole of the grounds have been laid out with very great care by Mr. E. KEMP, of Birkenhead.

MEMORIAL CHURCH, STREATHAM.

THIS church is about to be erected as a memorial to the Rev. STENTON EARDLEY, the late vicar of Immanuel Church, Streatham Common. The church as designed, with a north aisle only, provides about 500 seats, but the church is schemed for the future addition of a south aisle.

The architectural period chosen for the building is Perpendicular, and a principal feature of the design is the long line of clerestory windows, giving pleasant high lighting to the interior. The aisle is under three lead-covered roofs with low-pitched gables. The chancel is a continuation of the nave, the ridge line of the roof being unbroken. North of the chancel is a lofty organ chamber, above which is the belfry, the latter approached by an octagonal turret staircase. The church is of red brick, the dressings, mullions, &c., internally and externally, being of buff terra-cotta. The whole grouping of the building is, we consider, thoroughly picturesque and satisfactory, and it is treated with a breadth and quietude which gives singular dignity to the grouping.

HOUSE IN COLLINGHAM GARDENS, S.W., FOR MR. W. KEMP-WELCH.

THIS house forms one of the exceptionally interesting groups which Messrs. ERNEST GEORGE & PETO have been designing for Collingham Gardens, South Kensington, some of which we illustrated last year.

HOUSE AT ASCOT.

THIS house is about to be commenced near Ascot for Mr. CHARLES STONOR. The house is grouped round three sides of a courtyard, one side of which is formed by the picturesque and somewhat exceptional feature of a domestic chapel. This chapel is approached from the house, as well as having an external door which will enable it to be used by neighbours. An interesting feature in the chapel, which is 33 feet by 15 feet, is the western gallery with arcaded oak screen, approached from the first floor of house, and which will form a private gallery for the family. This is also approached by a visible and winding oak staircase from the general level of the chapel. The chapel roof is a very handsome one of English oak, of hammer-beam construction. On the north side of the chapel is placed the sacristy. Round the ample hall, which is panelled and has a beamed ceiling, are placed the drawing-room, morning-room, and dining-room. The latter is panelled with oak, and has a beamed ceiling. Along a portion of the south side is a verandah, which is so schemed as not to darken

the rooms along the front of which it runs, by their having bay windows which project as far as the face of verandah. Externally the lower portion of the house is built of rough cast on brickwork, with red-brick quoins. The chapel is entirely built of red brick, with Ham stone dressings. The upper portion of house is built partly with weather tiling and partly with oak half-timber work.

INTERIOR OF HALL, 19 HARRINGTON GARDENS, SOUTH KENSINGTON.

WE have much pleasure in being able this time to give a drawing of an internal portion of one of Messrs. ERNEST GEORGE & PETO's houses, as, though the insides are finished with great care, it is but seldom that they have ever managed to prepare a drawing enabling the public to see in what way they treat this portion of their work. The piece which they have selected to be illustrated this year is from a very beautiful house which they have lately built for Mr. W. S. GILBERT in Harrington Gardens, S.W. The drawing shows the oak-panelled entrance-hall, with its beamed ceiling as seen from the chimney corner in the hall. The staircase, with its steps in single blocks of solid oak, and its beautiful carved newel-posts running up to and supporting the ceiling, is also seen in this drawing. To the right of this is the picturesque oriel window, which gives light from Mrs. GILBERT's boudoir on to the hall. The boudoir is also lighted, of course, from the front of the house. We only wish that we could illustrate many of the other portions of this very interesting house, with its rich panellings of oak and solid rosewood, &c., and high old-fashioned chimneypieces reaching up to the ceilings. The one in the drawing-room is a hooded chimneypiece, up to ceiling, after the manner of those in the old French castles, being built in solid alabaster, and is a wonderful specimen of carving after the manner of the sixteenth century.

## VICTOR HUGO ON ARCHITECTS AND RESTORATION.

THE following extracts from the preface to "Notre Dame de Paris" (1831) may be of interest:—It is now several years ago, while visiting, or, to speak more correctly, while prying about in the church of Notre Dame, the author of this book discovered in a dark nook of one of the towers the following word, cut with a chisel on the wall—"Thanatos." The Greek capitals, black with age and sunk to some considerable depth in the stonework; the indescribable characteristics of Gothic writing impressed upon their forms and attitude, as if revealing that they were written by a Mediæval hand; and, above all, the sinister and fatalistic meaning they expressed, impressed the author forcibly. He asked himself, he endeavoured to imagine, what manner of man this troubled soul could have been who determined not to leave this world without imprinting this stigma of crime or of misfortune upon the forehead of the old cathedral. The wall has since been either whitewashed or scraped (I do not remember which it is), and the inscription has disappeared. It is thus that the wonderful churches of the Middle Ages have been treated for the last two hundred years. They are mutilated on every hand, both from without and from within. Th-priest whitewashes them, the architect scrapes them, thee comes the populace who pulls them down. Thus it is than apart from the fleeting recollection of it recorded here by tht, author of this book, nothing now remains of the mysterioue word graven on the sombre tower of Notre Dame—nothing os the unknown destiny which it summed up in such a melancholy fashion. The man who wrote this word upon the wall has been blotted out several centuries since from the land of the living; the word has been, in its turn, effaced from the walls of the church; the church itself will perhaps be shortly effaced from the earth. This word was the cause of this book being written.

Extract from Note added to the 8th Edition, 1832:—

The author expounds and expatiates in one of the chapters of this work upon the present decadence of architecture, and upon what appears to him to be the almost inevitable extinction of this kingly art, an opinion unhappily deeply rooted in him, and founded on mature consideration. But he feels here the necessity of explaining that he trusts most sincerely that he may one day be proved to be in the wrong. He is aware that art in all its various forms has much to hope for from the rising generation, whose budding genius one perceives in our studios. The seed is cast into the furrow, the harvest will certainly be fruitful. He fears, how-

ever (and the reader may see the reason why in the second volume of this edition), that the fertility of the ancient soil of architecture which has been for so many centuries the most productive field of art, may become exhausted. However that may be, there is at the present time in our young artists so much life, so much power, and, so to speak, so much predestination, that in our schools of architecture in particular at this moment, professors who are detestable turn out excellent pupils not only without knowing it, but positively in spite of themselves, exactly the reverse of the potter alluded to by Horace, who meditated on urns and produced pots: *currit rota, urceus exit*.

But at any rate, whatever the future of architecture may be, in whatever manner our young architects may one day settle the question of their art, while we are waiting for new buildings, let us preserve our ancient buildings. Let us inspire our countrymen with a love for our national architecture. This, the author avers, is one of the principal objects of this book, and also one of the principal objects of his life.

"Notre Dame de Paris" has, perhaps, opened out some new views with regard to Mediæval art, that wonderful art which is even at the present time unknown to many, and, what is still worse, is unappreciated by more. The author is very far from considering that he has fulfilled the task he voluntarily imposed upon himself. He has already pleaded on more than one occasion the cause of our ancient architecture, and has denounced aloud many profanations, many demolitions, and impious acts.

He will continue to do this. He undertakes to recur frequently to the subject; he will return to it. He will be as indefatigable to preserve our historical monuments as the iconoclasts of our schools and academies are determined to attack them. It is an afflicting circumstance to see into what hands the architecture of the Middle Ages has fallen, and in what manner the botchers (*gâcheurs de plâtre*) of the present day treat the mine of this grand art. It is a scandal that we intelligent men should look on and do nothing more than cry out. And it is not merely a question as to what takes place in the country, but of what is done at Paris, at our very doors, beneath our windows, in this great city, in the city of Lutetia, in the city of the printing press, of oratory, of thought. The author cannot resist the desire to finish this note by pointing out some of the acts of vandalism which are proposed, discussed, commenced, and carried out calmly under our noses, under the nose of the artistic public of Paris, and in spite of criticism which the audacity of the thing puts out of countenance. The Archbishop's Palace was recently pulled down—a building of little value. The loss is not very great; but in the same block with the Archbishop's Palace they have destroyed the Bishop's Palace, a rare relic of the fourteenth century, which the iconoclastic architect could not distinguish from the rest of the buildings. He has plucked up the corn with the tares; it is all the same to him. It is proposed to pull down the admirable chapel at Vincennes to construct some sort of fortification which Daumesnil never wanted. While that hovel, the Palais Bourbon, is being repaired and restored at a large expense, the magnificent stained-glass windows of the St. Chapelle are allowed to go to ruin by the action of the equinoctial gales.

A hoarding has been put up within the last few days around the Tower of St.-Jacques de la Boucherie, and one of these fine days it will fall under the pickaxe and be pulled down.

A bricklayer has been found to build a little white house between the venerable towers of the Palace of Justice. Another has been found for the Château of St.-Germain-des-Prés, the feudal abbey of the three spires. Another will doubtless be found to pull down St.-Germain-l'Auxerrois.

All these bricklayers, who call themselves architects, are paid by the Government or out of the privy purse, and wear green coats. All the ill that false taste can do to true taste they do. One of these men at the present time (deplorable sight!) holds possession of the Tuileries; another has scarred Philibert de l'Orme full in the face; and it certainly is not one of the least scandals of our age to see with what effrontery the heavy architecture of this gentleman swaggers in front of one of the most delicate fronts of the Renaissance period.

### EDINBURGH ARCHITECTURAL ASSOCIATION.

THE series of Saturday afternoon visits in connection with this Association was brought to a close for the season on Saturday, when a party, numbering over sixty members and their friends, made their annual excursion to Inchcolm Abbey, Donibristle, Dalgetty, and Aberdour Castle and Church, under the leadership of Mr. Hippolyte J. Blanc. The party left by special steamer in the forenoon, and on reaching Inchcolm the company assembled in the chapter-house, where an interesting paper, sketching the history of the monastery and abbey, was read by Mr. Blanc, who, by a plan prepared

from a survey of the buildings, together with a number of photographs specially taken, illustrated the various features of the edifice in the order of reference. Commencing with the Columban oratory, stated to have been erected in the sixth century, the company visited the various parts of the buildings, from the earliest in 1123 to the latest recorded in the fifteenth century. Donibristle, Dalgetty, Aberdour Church and Castle were afterwards visited in turn, and the many interesting features were pointed out. At the close of a very enjoyable day a hearty vote of thanks was accorded to Mr. Blanc for his very instructive papers.

### DEMOLITION OF CHURCHES IN YORK.

A PUBLIC meeting was held in the Corn Exchange at York on Saturday night, under the auspices of the Society for the Protection of Ancient Buildings, to protest against the destruction of certain ancient churches. The Hon. R. C. Grosvenor occupied the chair. The chairman said he felt somewhat in a peculiar position in presiding at a meeting in the ancient city of York to excite public opinion in favour of the preservation of the churches of the city. He was told that one thing that would be said in opposition to them—he understood that there might be some opposition to their views—was that their action was premature, and, in fact, that they were not face to face with a proposal for the demolition of certain York churches. He maintained, however, that the churches were of sufficient dignity and importance to justify them in meeting together not only to prevent the demolition which they might have supposed absolutely imminent, but that they might look forward into the future and raise in York such a feeling in favour of the preservation of those ancient churches that no one, either existing now or to come hereafter, would dare to lay a finger on them in any way. Whether rightly or wrongly, the Society for the Preservation of Ancient Buildings acted upon information extracted from a newspaper in York. That extract gave them a schedule of churches to be dealt with in a variety of ways; and they thought that, unless it were carefully watched, and unless it were publicly known that those churches were subjects of interest and would not quietly be allowed to be interfered with, those proposals would end in the disuse and eventual loss and destruction of those churches. He did not now propose to go at any length into the merits of the individual churches. He would, however, ask those present to take one instance which he himself had seen that day—namely, the church of St. Crux. That church, he thought no one would deny, was at one time one of the finest examples of a town church in England. He would, however, ask any one to look at it in its present condition and say what they thought of the treatment it had received. He had seen, besides, a picture of the interior of that church—a picture of very great merit and finish—showing that until recently the edifice displayed the interior of a most beautiful English church. But now what did he see? The whole church open to the sky and wind and wet, and everything allowed to have its will with that ancient building. If that had been done with regard to St. Crux, he thought they would agree with him that the society were justified in sending representatives to York—if anything could justify them—to ask the inhabitants to agree to a resolution that any interference, or demolition, or destruction, or disuse of the ancient churches of the city was something that would no longer be stood. He himself was neither an architect nor an archaeologist, but he had no doubt that there were many present who took, or would take, the same view of the matter as he did. He had the very greatest possible veneration and respect for works of ancient art, of whatever kind they might be; he looked upon the preservation of those relics of art as far more important than all the gold and silver and dross which surrounded the modern life in which they lived, and he would rather, for his own part, be present at a meeting which had for its object the preservation of those priceless memorials than do work of any other kind.

Mr. Wm. Morris, who next addressed the meeting, said that a city that had played such a part as York had in the history of the country, had yet kept itself together, and still to a certain extent might be looked upon as a due representative of what the city had been so many hundred years ago, and which had so many tokens of antiquity in it, must surely be more or less a place of pilgrimage for the whole world, and therefore he considered York, with its ancient buildings, to be part of the property of the whole world. That was his excuse for appearing on that platform that evening as the delegate of a society which had done a great deal throughout England in calling the attention of the population in general to the intrinsic merits of those ancient buildings with which the country was adorned. He could not help thinking that what lay at the root of the possible demolition of those buildings was that the promoters of demolition did not know their value. The expenses of a sustentation fund to keep the buildings in their places was

talked of as a very serious matter. Now if they suggested the removal of York Minster on such a plea there would be an universal condemnation of the idea, and a ready subscription of money to maintain the fabric. The churches dealt with in the York Church Extension scheme, though they might seem humble and modest, ought surely to have their share in that very same answer—"We can't afford to lose them." There was an idea, perhaps, in some people's minds that the value of a building was proportionate to the extent of the ground it covered. That was quite a mistake. There were, he ventured to say, many small and humble parish churches in England which were, in their way, quite as worthy of preservation as the largest cathedral in the country. Some of the churches in York were decidedly of that type. On several occasions he had been long days in wandering about the city, and every time he had been there he had found something fresh to see and admire in its ancient buildings. On that day he went into a church he had not entered before—namely, that of St. Martin-cum-Gregory. Now that church was one of those scheduled. He said distinctly that it was a noble example of a city church. It had also in it, as many churches in York had, some of the most beautiful specimens of stained glass he had ever seen. There was another church which he was told, though he could scarcely believe it, was considered by some people not to be worthy of preservation—namely, that of St. John, by Ouse Bridge. That church was a beautiful and rather distinguished example of a late form of Gothic. It was spacious and convenient for divine service; and it also had some noble specimens of the art of the painter in glass. The loss of such a church would be most seriously felt in York. Moreover, they must not look at those ancient buildings as so many works of art put under glass cases. They were part of the streets of York. If they pulled those churches down they would have a very commonplace city. The church of St. Crux had been wrecked because the people who had it in charge did not sufficiently take to heart the exhortation of that society to be very careful about the use of that terrible process, restoration. He could quite understand that the gentlemen who drew up the schedule really thought they were not doing quite as much damage by disusing the churches as they would do by destroying them. But, in point of fact, the two meant the same thing. If there was no sustentation fund to keep it going, and if it was not used, a building would die. There was a distinct life about a building, and especially about a church. If a building did not fulfil its proper functions it really died. An illustration of his meaning was to be found in Holy Trinity, Goodramgate, which was one of the most beautiful little churches in England. He considered that it was a disgrace to the city of York that it should be allowed to be in the state it was in now. In conclusion, he entreated them to find some use for their ancient churches. As to secularising churches, using them for commercial purposes, he would by no means do so. He thought there might be a middle course between using them for commercial purposes and deserting them. He thought they might be used for parish purposes, schools, or something of that kind. And, moreover, there was surely sufficient wealth in Yorkshire to provide sustentation funds. If not, then let them appeal to the whole of England, and if that was not enough to the English-speaking race, to the Americans who came over here by shoals. Surely they would get a response to their appeal. At any rate, he urged them to try to save themselves from the disgrace of inflicting a blow upon education, history, and civilisation by destroying buildings which it was their duty to protect. He concluded by moving, "That this meeting regrets the proposed destruction of certain ancient churches in the city of York, and hopes that steps may be taken for their preservation."

The Hon. Charles Wood seconded the resolution. He spoke of the historical, architectural, and antiquarian value of the churches which it was proposed to disuse, and said it was their duty to preserve them until the time arrived when they could be used.

Mr. Poppellwell Pullan: I am deputed by the council of the Royal Architectural Institute to express their full sympathy with the objects of this meeting—to express their regret that there should be found in this venerable ecclesiastical city a number of men who, on utilitarian principles, propose to destroy at one fell swoop seven or eight of their parish churches, which are at once landmarks of history and examples of architectural art. We regret this proposed destruction, I say, and our regret is deepened by a recollection of an opposite spirit to that of destruction which animated the citizens of York in former days. It was my privilege thirty-nine years ago, in 1846, to visit York, together with many fellow-members of the Architectural Institute, on the occasion of their annual congress. Those who were present will never forget the hospitality, the enthusiasm, the antiquarian zeal with which we were then welcomed. Some amongst you may have been present on that occasion; others may have heard of it. Under the guidance of that master of archæology, Professor Willis, we traced the gradual construction of the minster stone by stone. Under the guidance of

others, perhaps better versed in the local antiquities, we made a pilgrimage to the various parish churches. Amongst the antiquaries present on that occasion I may mention a name that should be dear to all citizens of York, for to his untiring zeal and perseverance they are indebted for a monograph of the minster more complete than anything that has been accomplished by any other man for any other cathedral. I mean John Browne, of whom York has good cause to be proud. Alas! Times have changed since then, for had any one then been bold enough to stand up and suggest the destruction of half a dozen of your parish churches, he would have run a risk of being torn to pieces by the crowd of enraged and enthusiastic antiquaries, as Hypatia was by the monks of Alexandria. Times are sadly changed when an architectural institute promoting the study of antiquities finds it necessary to send delegates to protest against acts of vandalism contemplated in the city which once so warmly sympathised with their zeal for the preservation of those ancient buildings, without which York would be an unattractive town. The term in the schedule is the apparently harmless word "disused." Let us consider what it means in its mildest acceptance. It means the loss to the parishioners of their accustomed services. These may be few in number, but they have, through a long series of years, become attached to their venerable churches, and love every nook and corner of the edifice where they worship according to the manner of their forefathers. But "disuse" implies decay. As it is not likely that there will be a sustentation fund for the preservation of the disused churches, it is probable that they will fall into ruin, like the church of the Holy Trinity, which I visited this morning. Now ruins are very picturesque. Fountains Abbey, Rivaulx, Jervaulx are very picturesque, and your noble minster never looked more so than as I remember seeing it after the fire in the nave in 1840, when the roof and the groining of the nave had fallen in, and you saw the tracery of the windows darkly defined against the sky. Still, I do not think you would care that York should be a city of ruined churches. But "disuse" leads frequently to something worse than decay—it leads to desecration. Those who know the larger cities of France and Italy will recollect the dozens of old churches that have been turned into bakeries, tanneries, and coachhouses at the time of the godless Revolution; and many of you will have been horrified to learn that to-day the French Government perpetrate the most terrible act of desecration ever known—that they desecrate an edifice dedicated to the worship of God in order that the body of a literary man who, if not himself an infidel, was the idol of infidels, might be deposited in it. The church of Ste.-Geneviève is again turned into a Panthéon, and its fine frescoes are to be demolished as unsuitable decorations for an edifice in which are interred the opponents of Christianity. I must own that I do not remember to have seen any old church in England turned to vile uses. We have still some respect for consecrated buildings; but who knows to what length the irreverent and levelling spirit of the age may lead? We have not yet heard of any proposal to turn your noble minster into a gymnasium, or otherwise utilising it for the benefit of the public; but this proposed destruction of churches is a step downwards in that direction, and we should recollect the old saying, "Facilis descensus Avernî." Again, "disuse" may lead to something even worse than desecration—I mean to destruction. For if a church be desecrated at one period, it may be reconsecrated for Divine worship at another, like the Panthéon or church of Ste.-Geneviève, or like the Madeleine, originally a Panthéon, now a church; but, if it be destroyed, a landmark of history is swept away for ever. All our old buildings, but especially our churches, are landmarks of history—ecclesiastical, national, provincial, individual, and artistic. If all documents were swept away and traditions forgotten, our old buildings would lead us to infer in what place and how long the Saxon, Norman, Plantagenets, &c., flourished. For instance, even if there were no remains of the Saxons under the minster choir, the tower of St. Mary, Bishop-hill parish, would show us that the Saxons had ecclesiastical establishments in this city. The architecture, the stained glass, and the monuments of your city churches afford the antiquary dates as to the men who built them and the times in which they lived, evidences of the progress of art, proofs of pedigrees and family history, and afford otherwise many connecting links in the long chain of national and provincial history, which it is more desirable to preserve even at the risk of a little inconvenience. I repeat they are evidences of the progress of the art of architecture, and upon that ground another reason for their retention may be urged. It may not be known to you all that there is one Gothic style which is peculiarly English, that is the Perpendicular, in which style the choirs of the minster and most of the parish churches are built. I have seen many churches in various parts of Europe, but amongst them have discovered nothing at all of the same character as our own national style. Hence we should value them for their architecture. I see from the schedule that it is proposed to remove bodily the church of St. Cuthbert. This is one redeeming feature in the programme. It is far better

that it should be removed than restored after the fashion of most late restorations, in which the original features of the edifices are so disguised as not to be recognisable. The restoration of our cathedrals and valuable churches should be undertaken by a committee of antiquaries. No architect in large practice has the time to give that serious study to restoration which is absolutely necessary. My final argument for the retention of the churches is this. The population of York, like that of all other large cities, increases rapidly, and who knows but that in fifty years time, if these churches are preserved, they may be crowded with worshippers? and who knows but that there will be many amongst them who will then thank us for the determined stand we have made against their destruction?

Mr. S. W. North, York, moved an amendment, "That this meeting has confidence in His Grace the Archbishop of York and the committee associated with him." Speaking as a member of the committee, he reciprocated to the fullest extent the sympathy for the ancient monuments which had been expressed from the platform. The congregations of certain parishes were so small that it was quite impossible to find congregations for the churches. They were bound also to provide for the minister's decent support, and the livings were such as barely provided sustenance for the ministers. He believed that the proposals of the committee were fraught with the very best intentions. It had never yet gone forth that any one of the churches would be destroyed, nor had such an intention ever entered into the minds of the committee.

Mr. W. W. Hargrove, York, a member of the committee, seconded the amendment, and said that neither in the circular calling the meeting to consider the requirements of the York parishes, nor at the meeting itself, was one single word uttered by the Archbishop of York on the subject of the removal of churches.

Mr. Wm. Chapman (York), Mr. Cobden Sanderson, Dr. Tempest Anderson (York), and the Rev. Newton Maut, supported the resolution.

The amendment, on being put to the meeting, was lost by a large majority, and the original motion adopted with three dissentients.

### ST. MICHAEL'S, COVENTRY.

A MEETING of the General Committee for the Restoration of St. Michael's Church and Steeple, Coventry, was held at St. Mary's Hall last week.

A member of the Committee moved that Mr. Thompson's tender for certain sections of the work be accepted as follows:—I. The tower and lantern stage (without internal restoration), 15,980*l.*; IA. The interior of the tower, groining, and floor over it, 1,398*l.*; II. The spire, including the rebuilding of the upper part, lightning conductor, &c., 1,262*l.*; total of tower and spire, 18,640*l.*; III. The nave roof, clerestory, and parapets, 4,308*l.*; IV. The chancel and apse, with the aisles to apse, 3,355*l.*; total, 28,303*l.* It was stated that when the work was in progress they would be able to examine the core of the walls of the tower, and to ascertain if they would be strong enough to support the bells.

Mr. J. O. Scott, the architect, in reply to whether he did not think it possible he could make the tower sufficiently strong to carry the bells with safety, said the tower was very weak, and always was. It was never intended for a heavy peal of bells; the walls were very thin for a tower of such a size.

The Mayor seconded the resolution, with the exception that the groined roof and floor in the tower should not be proceeded with without the express order of the Committee, and in that form it was carried.

It was also resolved to insure the church for 20,000*l.* and the tower and spire for 20,000*l.*, and to allow a margin of 1,000*l.* for contingencies at the architect's discretion.

### BIRMINGHAM ARCHITECTURAL ASSOCIATION.

ON Saturday last the members of the above Association paid a visit to the New Liberal Club, now in course of erection in Edmund Street. Amongst those present were Messrs. J. Cossins, W. H. Kendrick (vice-president), Victor Scruton (hon. sec.), A. Hale, F. Bailey, T. Newton, O. Essex, H. H. McConnal, C. E. Bateman, A. J. Craddock, J. Goodman, W. Midgeley, &c. Before inspecting the building Mr. Cossins conducted the members to the Clerk of Works Office, where a thorough inspection was made of the plans, sections, and elevations of the club. The arrangement and disposition of the various departments were fully discussed, and much interest was shown in a novel device, in case of fire, consisting of an iron handrail ladder, running externally from the top of the building to the bottom. Under the guidance of Mr. Cossins,

the members then visited the whole of the building, commencing with the basement and working upwards to the culinary department and tower. After descending, and congratulating Mr. Cossins upon his very successful design, the members dispersed.

### LIVERPOOL ARCHITECTURAL SOCIETY.

THE first meeting of the recently inaugurated Junior Debating Club, membership of which is free to all professional non-practising members—i.e., assistants and students only—of the society, was held on the evening of the 1st inst. at the society's rooms, No. 9 Cook Street, when Mr. Walter H. Brierley read a paper entitled "Pitfalls," detailing many of the errors to which the young practitioner is liable, and showing how they may be avoided. Mr. James Nicholson was voted chairman for the evening. There was a good attendance, and an interesting discussion followed, participated in by Messrs. J. B. Hikins, E. Percy Hinds, Richard Holt, C. J. Andersson, Charles R. Chidson, W. N. Stephenson, Thomas J. Dalziel (visitor), G. Hornblower, and the chairman. The next meeting will be held on June 15, when a paper will be read by Mr. T. J. Dalziel on "Early Gothic Vaulting."

"Antiquity after a time has the grace of novelty."—HAZLITT.

### THE BUILDING ACCOUNTS OF THE GREAT HALL AT HAMPTON COURT.

IN the course of the present season there will be many a visit paid to Hampton Court, the building which of all others about London has most attraction for Parisians, since it appears to them to be an English version of Versailles. It is commonly believed that the more ancient parts of the palace were raised by Cardinal Wolsey on the ground which had been assigned to him by the Knights Hospitallers, and that the complete building was handed over to King Henry VIII. as a gift. But with the great hall, which forms so important a feature in the building, Wolsey had nothing to do, for the foundations were not laid until 1531, whereas the cardinal made over possession to the king in 1525. In the ample description by Cavendish of the banquet which was given to the French nobles by Wolsey there is no mention of a large hall, and the tables were laid in "the first waiting chamber" and "the chamber of presence." When painters represent the cardinal as sitting in state in the existing hall, they commit an anachronism. The accounts for the building of the new hall have been preserved, and the following extracts from them will suggest how books were kept in those days as well as the prices paid for labour and materials:—

#### *Taking Down Old Hall.*

Three sawers of tymber (by taske) for the new scalfalde to take downe the olde hall at 12*d.* every hundred foot. 16 Oct., Anno 22.

Carpenters makynge of a framyd scaffold to take down the rouff of the olde hall, every of them at 6*d.* the day.

Payd to Thomas Ward for his wages, by the space of 24 workynge daies, makynge of hodds and helpynge the scaffold maker to make long barrowes, whele barrowes, and ladders for the said works, 8*s.*

Tylers takynge down and sortynge of tyles of the old hall at 8*d.*, some 6*d.*, and some 5*d.* the day.

Payd to Hugh Diker, tiler, for his wages helpynge to taken down tiles and to uncover the olde hall, by the space of 4 daies, at 6*d.* the day.

Laborers helpynge to take down the olde hall 4*d.* the day.

Warden and setters takynge down of the freeston of the olde hall, 3*s.* 8*d.* the week, each of them.

Carpenters helpynge to take down the olde hall, and sortynge of the tymber of the rouff of the same at 8*d.*, some 6*d.*, and some 4*d.* the day.

#### *Tools and Materials required for Erection of New Hall.*

Empcyon of mattocks for to dygge the foundacyons of the new hall. Anno 22.

Empcyon of scaffold polls for to make the scaffold for the new hall, at 6*d.* the lod: also of great longe oken and alder polls, at 2*s.* 6*d.* the lode.

Payd to William Love, of Bronxam, for 10,000 of bryke, at 4*s.* 6*d.* the thowsande, of him bowght and delyvered at Taplow quarry.

Carters carrying of briks from the brik-kill, and also chalke

from the water side to the foundations of the hall, at 14*d.* the day.

Paid Henry Burde, of Kyngston, for a new cowle for the mortar pytt, 12*d.*

Item, for a scope for the same, 4*d.*

Item, for mending and repaying of the old cowle, a new bottom, 6 hopes and 2 eyrs, 10*d.*

Fifty-two lodes 4 quarters 6 boshells of lyme, reddy burnyd and delyveryd at Taplow quarre, at 10*d.* the quarter.

Chalke at 2*d.* the lode.

Payd to John Norse, merchaunt of Rone, for 4 mounghte of plaister of Paryshe, of him bought and delyvered at the Toure wharf, at 6*s.* the mounghte.

Rygate stone, at 4*s.* 2*d.* the ton.

Payd to Thomas Yerley of Kyngston, for two handropes to rere the rouff of the New Hall, pondering, 29 lb. at 2*d.* the lb.

Six crowys of irne, serving to raise the rouff of the New Hall, pondering, 104 lb. at 1½*d.* per lb. Thirteen pynns serving to joyne the ruff together of the New Hall, pondering, 46 lb. at 1½*d.* per lb.

#### *Bricklayers, Masons, and Carpenters.*

Bricklayers working in and upon the foundations of the New Hall, every of them at 6*d.* the day.

Free masons, at 3*s.* the weke, every of them working in freston upon dores, wyndowes, coyenes for buttresses, and gresse tables for the Kynges New Hall.

Carpenters working upon the flowres of the said Hall, every of them at 6*d.* the day. In March, anno 23.

Carpenters for working in their howre tymys and drynkyng tymys upon the Hall rought for the hasty expedition of the same—every of them rated for every 9 hours 7*d.* in all emongs them. Joyners were paid at the same price. In May, anno 24.

#### *Masonry.*

Payd to John Ells of Wesmyster, fremason, for makyng and intayling of two bullins in freston standing in the woghte of the great baywyndow in the Kynges New Hall, at 10*s.* the pece.

Payd to John Whighte, of Wynchester, fre mason, for workyng, karvyng, and gravyng, and intaylling yn fre ston of 6 bokkets for 3 dores of the New Hall, whereof 2 stond upon the northe syde and oon on the southe syde of the sayd Hall, by a bargin in taske, 6*l.*

Payd to John Wright, of Southe Memys, fre mason, for workyng, karvyng, and intaylling of 16 severalle fre stones for the reprints of the Kynges New Hall, whereof two of them curiously engraved wyth the Kynges armes, wyth the crowne, and two of the Kynges best stande at the upper ende of the sayd Hall, and ten other of the sayd stones ingravd, five of them wyth roses, and other five wyth portocolos, every of them wyth two of the Kynges beasts counteryng one agenst an other, stand on ether syde of the sayd Hall, and other rest of the sayd 16 stones ingravd with the letters H and R; every of them wyth the crowne stand in the four anguls of the same Hall, takeing for every of the sayd stones soo brought, clensyd, and fully fynyshe, by convensyon, 22*s.* 6*d.*

Payd to John Wright, free mason, for the workyng and makyng of a lyon and a dragon in ston, standing at the gabyll ends of the Kynges New Hall, at 16*s.* the pece.

Also payd to the same John, for the workyng and makyng of 16 beest in freston, standing upon the crest at both the gabull ends of the said Hall, at 5*s.* 4*d.* the pece.

Payd to Thomas Johnson, of London, karver, for makyng of 29 of the Kynges bestes to stand upon the newe batilments of the Kynges New Hall, and upon the femerell of the said Hall, taking for every of them so made and set up, 16*s.* 8*d.*

#### *Carving.*

Payd to Richard Rydge, of London, karver, for the makyng of three pendentts hangyng upon the femerall of the Kynges New Haull reddy feneshyd and set up, at 40*s.* the pece.

Payd to Richard Rydge, of London, karver, for cutting and karvyng of a rose crowynd standing in the crowne vought of the femerall of the Hall, 13*s.* 4*d.*

Also payd to Richard Rydge, of London, karver, for the makyng of 16 pendaunts standing under the hammer-beam in the King's New Hall, at 3*s.* 4*d.* the pece.

Payd to Richard Rydge, of London, kerver, for the makyng of 28 pendaunts stondyng in the crosse mowntyn above the hamer beame in the Kynges New Haull, at 25*s.* a pece.

Payd to William Baldwyn, for lyke couttyng of 12 traylls standing above the hamer beame in the Hall, at 12*d.*

Payde to Mychell Joyner, for couttyng of 26 spandrells standing in the plum basys under the nether purloyns in the Kynges New Hall, at 20*d.* the pece.

Payd to Richard Rydge, of London, carver, for cutting and carving of 32 lintells wrought with the King's badges and the Queen's standing in the screens within the King's New Hall, 2*s.* 2*d.* the pece.

Payd to Richard Rydge, of London, kerver, for the makyng of 28 hedds, standing upon the fote of the arche over the syde

of hathemmerbeam, within the Kynges new hall, at 12*d.* the pece.

Payd to Mychell Joyner, for the makyng of 250 of the Kynges and Quenys badges, standing upon the caters within the said hall, at 5*d.* the pece.

Payd to the forsaid Richard Rydge, for the makyng of 20 pendaunts, standing in the upper purloyns within the Kynges new hall, at 25*s.* the pece.

Payd to Thomas Johnson, of London, karver, for the makyng of 26 spandrells, to stand upon the reprice under the hammer-beame within the Kynges new hall, at 40*s.* the pece.

Also payd to Ric. Rydge, of London, karver, for karvyng and couttyng of 2 grewhondes, oon lybert, serving to stande upon the typpis of the vycys abowght the Kynges new haull, at 18*s.* 4*d.* the pece, by convention.

#### *Ironwork.*

Payd to John à Guylders, smythe, for eight score and 10 lokketts, 25 stay barres, and 83 standards, serving for the lower traunsome wyndows of the new hall, pondering 28 cwt. 92 lb., every cwt. conteyning 112 lb., at 1½*d.* the lb.

John à Guylders, smythe, for 6 payre and oon odde hooke of ston hooks, serving for the new hall, at 1½*d.* the lb.

Payd to John à Guylders, smythe, for two payre of ston hooks, serving the two vysis at the west ende of the kynges new hall, at 1½*d.* per lb.

Payd to William Johnson, for 26 great pyller for the chaptrell of the bossell of the hall, at 13*d.* the fote.

Payd to John à Guylders, smythe, for 40 fodletts for the harnesyng of the great window at the est ende of the haull, and 12 lyke fodletts for two lyghts over the said wyndow, pondryng 33 lb., at 1½*d.* per lb.

Also, for two pynns of irne, for stayes for the two bests of freston, standing at the gabylls ends of the haull, pondering two lb., at 1½*d.* per lb.

To John à Gwylders, smethe, for the great pryncypall vane baryng the close crowne, upon the femerall of the Kynges new haull, 40*s.*

Payd to John à Guylders, for 16 vanys for the bestes, standing upon the battylment of the hall, at 4*s.* the pece.

Payd to the same for 16 standards, 6 staybars, and 32 locketts, serving for the great bay wyndow in the southe syde of the Kynges new hall, at 1½*d.* per lb.

Also, payd to John à Gwylders, for a payre of ston henges, serving the dore at the vyce fote goyng up to the batylmentes of the haull, pondryng 14 lb., at 1½*d.* per lb.

Also, payd to John à Gwylders, for 2 pair of stone henges, oon payre serving the store-yerde dore, by the serving place, the other serving a dore under the haull place stayre, pondering 27 lb., at 1½*d.* the lb.

Item, to John à Gwylders, for 3800 of myddyll brodds, at 12*d.* the hundreth, spent upon the croke and dubbers in the kyngs new haull.

Payde for 250 of great brodds for the jowl-pesys in the sayd haull, at 2*s.* the 100.

Two thousand twopenny nails at 10*d.* the 1000, for the selyn bourde in the upper rouff in the hall.

Two hundred of great broddes for the skrenys in the Kinges new haull, price, the hundred, 23*s.* 4*d.*

Payde to Raynalde Warde, of Budley, for 7350 of dubbyll tenpenny nayles inglys, at 11*s.* the 1000. Also, 2000 of synggle tenpenny nayles, at 5*s.* 8*d.* the 1000. Also, 12,000 of sixpenny nayles, at 3*s.* 6*d.* the 1000. Also, 5000 of fivepenny nayles, at 2*s.* 10*d.* the 1000. Also 4000 of fourpenny nayles, at 2*s.* 4*d.* the 1000. Also 1500 of rought nayles, at 10*d.* the 1000.

(To be continued.)

#### **The Architectural Association.**

SIR,—The adjournment of the debate upon the question of doubling the subscription to the Association gives me the chance of writing what I meant to say had I been present at the meeting.

If the resolution be passed I hope it may effect all the good its authors anticipate. If, however, the criterion be the greatest good to the greatest number, I fear that the contemplated change will diminish rather than extend the usefulness of the Association. Double the subscription, and you at once weed out of its ranks the poorer students, who must need study proportion in money matters, though they may fail to find it in the architectural designs they spend their days in tracing. That the bounds of this useful society should be thus narrowed by the exclusion of the poorer student would be a matter for sincere regret; and the change would be all the more significant and regrettable coming at a time when, in another realm

of art, the College of Music is opening wide its doors to the poorest lad or girl in the land who has musical genius. It is well, I think, that this side of the question should be considered, even if great gains are expected from the change in other ways.

If, indeed, the sum of 300*l.* (which I understand is the sum it is hoped to raise by means of the increased annual subscription) be so necessary to the effectual working of the Association classes, why not get the Institute to make a yearly grant of this sum, and leave the subscription at its present figure? The ample funds of the Institute are at present mostly expended in guarding the rights and decencies of the profession; but this scarcely fulfils all that His Britannic Majesty expected of it when he granted its charter expressly for the advancement of art. Here, then, is a way in which the Institute can advance the study of architecture and at the same time do something to redeem its name.

And it seems to me the bounden duty of the Institute to help this school of young architects in some such practical way as I have indicated. Is it not written in the articles which bind the pupil to the service of the F.R.I.B.A. that the indulgent master shall allow the pupil "all reasonable facilities for attending classes of the Architectural Association or other kindred institutions"? Why, then, should not the Fellows of the Institute contribute (at least indirectly) to the sustenance of an excellent but needy educational society which gives to their pupils that knowledge of architecture they themselves are continually paid good round sums to teach?

JOHN D. SEDDING.

### SCHOOL BUILDINGS.

**Kidderminster.**—A new school for girls has been opened. The school is in immediate proximity to the church of St. John's, and is a plain building in the Early Lancet style, built of brick, with tiled roof. It is well arranged internally, the main room and class-room being convertible, when so required, into one large room for parochial purposes. The building has been erected by Mr. H. Smith, from the plans of Mr. J. T. Meredith, and accommodation is afforded for 357 girls.

**Birchfield.**—The foundation-stone of a Congregational Sunday School and Lecture Hall at Westminster Road, Birchfield, has been laid. The building, which is to cost about 1,200*l.*, has been designed by Messrs. Ingall & Hughes, of Temple Row West, Birmingham, and is being erected by Mr. W. Bennett, of Berners Street, Lozells. The style of architecture is Gothic, and the general appearance of the building is to harmonise very closely with that of the adjoining chapel.

**Todmorden.**—The corner-stones have been laid of a Primitive Methodist school at Knowlwood. The new school is being built on the site of the old structure, and has been designed by Mr. Jesse Horsfall, architect, of Todmorden and Rochdale. Mr. B. Lumb, of Todmorden, is the contractor, and the estimated cost is 1,200*l.*

### CHURCH BUILDING AND RESTORATION.

**Edinburgh.**—The demolition of the old Abercorn Free Church has been begun, and a new church is to be erected on the site. The new church is a parallelogram with octagonal end where the pulpit is placed, the front gable to the roadway being buttressed and terminated with a small belfry. The accommodation of the new church is about 400. The architect is Mr. Hippolyte J. Blanc, Edinburgh.

**West Kensington.**—A new Congregational church, designed in Early Gothic character, has been opened. The building on plan is cruciform, and has a massive central tower and a clerestory supported by flying buttresses. The roofs are of red tiles, and the walls of stone, lined inside with buff-coloured terra-cotta. The architect of the church is Mr. James Cubitt, with whom Mr. J. M. Brydon was for a short time associated. Messrs. Howell & Son, of Bristol, are the builders.

**Staithes.**—A new church, dedicated to "Our Lady the Star of the Sea," erected by the Catholics at Staithes Bank Top, has been formally opened by Dr. Lacy, Bishop of Middlesbrough. The church has been designed by Mr. Martin Carr, Middlesbrough, and the builder is Mr. Dickenson, of Saltburn. The style of architecture is Gothic, and the total cost is about 1,250*l.*

**Gedding.**—The old church has been restored and reopened. The work has been carried out by Mr. Robert Tooley, contractor, under the direction of Mr. E. F. Bisshopp, of Ipswich. A few months ago the nave was a ruin. The tiles had been mostly stripped off the roof, leaving the exposed timbers to decay, mortar from the walls and rubbish from the plastered ceiling lying in heaps among the ancient low oak benches and the modern high deal pews. The font, a large and handsome stone octagon, lay partly buried

in the brick floor, sadly disfigured with barbarous paint and neglectful carelessness. The triple chancel arch—a quaint and curious feature, resembling old Temple Bar with its needle-eye for pedestrians on either side of the main opening—had been deplorably mutilated, while the chancel itself was wretchedly mean-looking, with its weather-stained walls and shabby furniture, and the churchyard was as unsightly as the building in its midst.

### GENERAL.

**A Model** after Sir Frederick Leighton's well-known picture *Engaged* has been completed. The group is about three feet high, and will shortly be cast in bronze for the Fine Art Society.

**A Collection of Pictures**, valued at over 10,000*l.*, has been left to the town of Wednesbury, with 3,500*l.* towards the building of an art gallery and providing for the salary of a curator, &c., by Mrs. Richards, Wood Green, widow of Mr. E. Richards, formerly a coachsmith, carrying on business at Wednesbury. The pictures number between 200 and 300, and among them are works by Sidney Cooper, R.A., Leader, A.R.A., Goodall, R.A., Henshaw, Syer, Birket Foster, Webb, Marcus Stone, A.R.A., H. Dawson, sen., A. Vickers, and other artists.

**Mr. Thomas Woolner, R.A.**, has completed for the Government of New South Wales bronze portrait busts of Lord Palmerston, Lord Russell, Lord Derby, Lord Beaconsfield, and Mr. Gladstone. These busts are to be placed in the Executive Council Chamber in Sydney.

**A Bust** or tablet is to be placed in Bristol Cathedral as a memorial of the late Mr. F. Fergus, who was so widely known as Hugh Conway.

**The Lord Lieutenant of Ireland** has written to the Mayor of Barrow-in-Furness intimating that if the necessary arrangements can be made he will be prepared to unveil the statue of the late Lord Frederick Cavendish, executed by Mr. Bruce Joy, to be erected in the Town Hall Square at Barrow during the present month.

**A New Oak Porch** has been added to Downe Church, Kent, at a cost of about 100*l.*, by Mr. Balding, builder, of Bromley, from the designs and under the superintendence of Mr. St. Pierre Harris, architect, of 1 Basinghall Street.

**The Sketching Club** of the Leeds and Yorkshire Architectural Society held their first monthly meeting on Monday evening, when sketches produced by the members during the last month were exhibited.

**The Collection** of sculptures from Pergamos, which is being gathered at Berlin, has just received a slab representing the death of a giant in the war between the gods and the giants.

**Mr. F. Whitmore**, formerly a pupil of the late Mr. R. M. Phipson, of Ipswich, and fifteen years Surveyor to the Chelmsford Local Board, has been appointed County Surveyor of West Suffolk. Among the candidates were Mr. H. N. Maynard, London; Mr. H. Miller, jun., C.E., Ipswich; and Mr. J. S. Moye, London.

**Sir E. C. Guinness**, Dublin, has contributed 50*l.* towards the forthcoming Artisans' Exhibition, with the intention that 25*l.* should be applied to providing prizes for the manufacture of Irish lace and carved wood, and the remaining 25*l.* to one general decoration of one building.

**At a Special Meeting** of the Incorporated Society of British Artists, on Tuesday evening, Mr. Mortimer L. Mompes was elected a member.

**St. Paul's Church**, Woodford Bridge, Essex, opened in 1854, was destroyed by fire on Monday.

**At a Meeting** of the Dublin Corporation on Monday, Mr. Freeman was re-elected City Architect.

**Mr. Arthur Pease, M.P.**, has promised to lay the foundation-stone of the new Temperance Mission Hall in Royal Road, Kennington Park, on Saturday next, at 4 P.M. Lady Brassey and Mrs. W. J. Armitage will also lay two tablet stones on the same day. The architect is Mr. Banister Fletcher, F.R.I.B.A. Tickets to admit to the ceremonies may be obtained on application to the architect, 29 New Bridge Street, Blackfriars; or to Mr. C. Zierenberg, St. James's Home for Female Inebriates, Kennington Park.

**An Old Roman Shield** has been found at Traismauer, in Lower Austria, some miles south-west of Vienna. A large portion of a votive shield of bronze was found among a great quantity of fragments of glass and earthenware. On the obverse is an eagle, and below it Jupiter in Roman war dress, with an axe in his raised right hand. On the reverse is a full moon, and below it a young Mars. It is conjectured that the shield belongs to the third century of our era.

**The Nottingham Corporation** have decided to purchase, at a cost of 141,000*l.*, a number of small unhealthy tenements in the centre of the town, and to erect upon the spot a hospital at a further expenditure of 26,000*l.*

A Business Supplement

# The Contract Reporter.

to The Architect.

LONDON, JUNE 6, 1885.

## TRADE NOTES.

ON Monday, June 8, an Exhibition of Domestic Appliances will be opened at the Parkes Museum of Hygiene. Mr. Fletcher, of Warrington, will supply the apparatus, and a series of lectures on "Cookery" will be given, illustrated by experiments.

THE whole of the rubbers and facing bricks used in the erection of Buchan Hill Mansion, Herefordshire, in memory of the late Dr. G. Foote. The subject represented is "Christ Healing the Sick." The work has been designed and executed by Mayer & Co.

A FOUR-LIGHT Munich window has lately been erected in the parish church of Kington, Herefordshire, in memory of the late Dr. G. Foote. The subject represented is "Christ Healing the Sick." The work has been designed and executed by Mayer & Co.

MR. JOHN JONES, of Walker's Croft, Manchester, has received instructions to supply the whole of the wrought-iron window casements for the following buildings:—Deaf and Dumb Schools, Old Trafford; Wilton Hotel, Manchester; Wesleyan Schools, Stockport; and all brass casements throughout for Rainford Hall. The whole are to be fitted with improved handles and quadrants. Also all the internal fittings, pulpits, &c., for Slade Lane and Stretford Churches.

A HANDSOME stained-glass window, executed by Messrs. Heaton, Butler & Bayne, Garrick Street, London, has just been placed in the north transept of Sopley Church, Hampshire. The window consists of four lights, and the inscription is as follows:—"To the glory of God: a thankoffering from Lieutenant-General Sir George Willis, Knight of the Bath, of the Osmanieh of the Medjidi, Grand Officer of the Legion of Honour, &c., commanding the Southern Division, and Governor of Portsmouth, 1885."

## THE FORTH BRIDGE.

LAST week, on Friday, the Lord High Commissioner and the Countess of Aberdeen paid a visit to the Forth Bridge works at South Queensferry. On reaching the temporary station erected for the Forth Bridge workmen at South Queensferry, the visitors were received by Sir Thos. Tancred, Mr. Arrol, and Mr. Phillips, partners of the firm of Messrs. Tancred, Arrol & Co., contractors for the construction of the bridge. A large caisson, the sixth and last of the series required in connection with the bridge, was in readiness to be launched from its position at the south side of the Firth, and this ceremony the Countess deftly performed by cutting a rope fastened to a platform which had been erected for the occasion. Cheers were given by a large number of spectators as the huge, pipe-like structure glided successfully into the water. This caisson, which is similar in construction to the other five now in the

water, is intended as a support for the south-west pier at Inchgarvie. It is 70 feet in diameter at the base, and over 45 feet in height. In the operation of finally placing or sinking this structure the lower portion of the interior is filled with compressed air, supplied through a vertical central channel having valved openings. Into this lower chamber workmen, principally Italians, who do not feel the heavy air pressure so much as others, descend for the purpose of clearing the sea bottom, in order that the necessary depth may be reached, the density of the interior air being sufficient to prevent the inflow of water. The material excavated from the bottom by the men is raised to the surface by an interior central channel. One of the caissons now in position was loaded with no less than 3,600 tons of concrete.

## COMPETITIONS OPEN.

BOURNEMOUTH.—Aug. 19.—Designs are invited for the Construction of Two Marine Piers. Mr. G. R. Andrews, Town Surveyor, Bournemouth.

BRISTOL.—July 20.—Designs are invited for the Erection of Board Schools, Castle Green, for 1,000 children. Mr. Benjamin Wilson, Clerk to the School Board, Guildhall, Bristol.

NORTHFLEET.—June 23.—Plans are invited for the Erection of Schools to accommodate 200 Boys, 150 Girls, and 150 Infants. Mr. Fred. Mitchell, 49 Windmill Street, Gravesend.

LIVERPOOL.—Aug. 1.—Designs are invited for the Erection of Dwellings for the Labouring Classes. Mr. G. J. Atkinson, Town Clerk, Municipal Offices, Liverpool.

## CONTRACTS OPEN.

ABERDARE.—June 9.—For Erection of Pavilion, Offices, Fences, &c., for the Eisteddfod. Mr. J. R. Lewis, General Secretary, 11 Cannon Street, Aberdare.

AMBLE.—June 16.—For Erection of Co-operative Store Buildings. Messrs. Oliver & Leeson, Architects, Newcastle-on-Tyne.

ASHTON-UNDER-LYNE.—June 8.—For Building two Blocks of Houses. Messrs. T. D. & J. Lindley, Architects, Ashton-under-Lyne.

BANDON.—June 8.—For Construction of Water Works. Mr. James Price, C.E., 44 Harcourt Street, Dublin.

BARNARD CASTLE.—June 8.—For Cutting Trench and Laying Water Pipes (370 yards). Mr. George Carter, Surveyor.

BEESTON.—June 13.—For Rebuilding St. Mary's Church. Mr. C. H. Thornton, Architect, 3 Park Row, Leeds.

BEITH.—June 11.—For Construction of Additional Water Supply Works. Mr. W. R. Copland, C.E., 146 West Regent Street, Glasgow.

BILBAO.—June 26.—For Building Theatre. Messrs. Yves & Co., 24 Fenchurch Street, E.C.

BIRKENHEAD.—June 19.—For Building Purifying House at the Gasworks. Mr. T. O. Paterson, Gas Engineer, Birkenhead.

BISHOP AUCKLAND.—June 17.—For Construction of Passenger Station. Mr. William Bell, Architect, Railway Offices, Northgate, Darlington.

BOHERBOY.—June 11.—For Building Doctor's Residence, &c., and Dispensary. Mr. T. Guiney, Clerk to the Guardians, Kanturk, Ireland.

BOURNEMOUTH.—For Erection of Gervis Buildings. Mr. H. E. Hawker, Architect, 5 Town Hall Chambers, Bournemouth.

BRIGHOUSE.—June 16.—For Building Public Offices. Mr. John Lord, jun., Architect, Church Street, Brighouse.

BURY.—June 8.—For Building School at Fishpool. Messrs. Maxwell & Tuke, Architects, Bury.

CARDIFF.—June 12.—For Building Nurses' Bedrooms at the Workhouse. Messrs. James, Seward & Thomas, Architects, St. John's Square, Cardiff.

CARNFORTH.—June 12.—For Building Four Shops and Business Premises. Mr. S. Shaw, Architect, Kendal.

CHELSEA.—June 9.—For Construction of Disinfecting Station at Wharf No. 2. Mr. G. R. Strachan, Surveyor to the Vestry, Vestry Hall, King's Road, S.W.

CHESTERFIELD.—June 6.—For Alterations to Post Office. The Postmaster, Chesterfield.

DALCHOIRLICH.—June 10.—For Additions and Alterations to Farm Steading and Construction of Bridge over River Lyon. Messrs. Mackenzie, Innes & Logan, 23 Queen Street, Edinburgh.

DARTFORD.—June 6.—For Erection of Building to accommodate Staff, Engine-house, and Extension of Laundries, Long Reach. Messrs. H. Jarvis & Son, Architects, 29 Trinity Square.

DEVONPORT.—For Construction of Piers, Brick Arches, and Limestone Rubble Walls. Mr. John Willing, Secretary to the Devonport Gas and Coke Company, Keyham.

DOUGLAS WATER.—For Building Free Church and Manse. Mr. J. B. Wilson, Architect, 112 Bath Street, Glasgow.

DUBLIN.—June 10.—For Fog Bells and Lighthouse Machinery. Mr. Bindon B. Stoney, Engineer, North Wall, Dublin.

DUNDEE.—For Supplying Sets of Hoisting Apparatus and Machinery. Mr. R. F. Anderson, C.E., 84 Commercial Street, Dundee.

# R. ADAMS,

17 BLACKMAN STREET & 7 GREAT DOVER STREET, LONDON, S.E.,

INVENTOR and PATENTEE of the

## SAFETY WINDOW WITH REVERSIBLE SASHES

FOR

### INEXPENSIVE & PERPETUAL CLEANLINESS

Which has gained at the INTERNATIONAL HEALTH and  
SANITARY EXHIBITIONS

2 Gold, 4 Silver, and 4 Bronze Medals,  
and 16 Diplomas of Merit.

The fearful sacrifice yearly of Life and Limb of persons in cleaning windows through sitting or standing outside whilst so engaged is most appalling. This can now be entirely prevented. The Patentee, having given this subject the most exhaustive study, is now prepared to supply his patent fittings suitable both for old and new windows at prices to meet the means of all. These improvements are protected by several patents, by each of which the outside of each sash can be reversed for cleaning, and under this new system that duty is rendered a pleasure, whilst the danger, risk, and tremendous responsibility of moral and statute law is removed.

These patent fittings can be procured from 5s. for each sash, and all builders have the right conferred upon them to fit the same in the purchase thereof, and that all shall have the benefit of this national boon, special Agencies are being established throughout the United Kingdom. None but practical and responsible firms are appointed. Such firms are invited to apply for unrepresented districts at once, as it is desirable to complete the list as soon as possible.

The present representatives are:—

Barnstaple

# RENDLE'S "ACME" GLAZING

(REGD)

Patentees:—**W. E. RENDLE & CO.,**

3 WESTMINSTER CHAMBERS, VICTORIA STREET, LONDON.

TO  
ARCHITECTS, BUILDERS,  
AND  
CONTRACTORS.

**STEEL CUT NAILS!!**

The modern and important discovery in the process of making Steel has so reduced the price, that Steel Cut Nails of the well-known "Mitre Brand" can now be supplied at only 1s. 6d. per cwt. more than the price of the ordinary Common Iron Cut Nails.

The Steel Cut Nails are far superior in quality and more uniform in size than any wrought or hand-made Nails yet produced, and being lighter in weight than ordinary Iron Cut Nails and free from waters, they are found cheaper in actual use than common Iron Cut Nails at 1s. 6d. per cwt. less.

These Steel Cut Nails are specially suited for Builders, Joiners, Coopers, Paving-Case Makers, &c., and a single trial is sufficient to convince any one of their superior quality and cheapness.

**PATENT WROUGHT STEEL NAILS.**

**OVAL WIRE NAILS.**

Ask your Factor or Ironmonger for  
"MITRE NAILS."  
WHOLESALE AND EXPORT ONLY.

FIRST-CLASS CERTIFICATE AND SILVER MEDAL  
AT CALCUTTA EXHIBITION.

**SAND. SAND.**

BEST AND CHEAPEST FOR BUILDERS' PURPOSES.  
Guaranteed Sharp and Clean.

For sample, price, railway and canal rates, apply to  
E. J. BISHOP & SONS, Sand Pits, Leighton Buzzard.

**G. & T. EARLE,  
HULL,**  
MANUFACTURERS OF LIGHT, DARK AND PORTLAND CEMENTS,  
LIAS LIME AND MASTIC,  
PLASTER PARIAN, KEEN'S PARIS WHITE, HAIR LATHS, ETC.

EARLE'S PORTLAND CEMENT is the best adopted for stucco work, and for use in sewage works and the construction of Gas Holder Tanks.

EARLE'S LIGHT ROMAN CEMENT sets very rapidly, and is specially useful in cases where the sea or a tidal river has to be contended with.

**QUANTITIES, ETC.**

Correctly Written and  
Lithographed by return of post  
certain.

**J. L. ALLDAY.**

Shakespeare Steam Printing  
Works,  
COLMORE ROW,  
BIRMINGHAM.

Disinfecting Fluids, Powders, Soaps, Ointments, Furniture Cream, Fumigators, &c., &c.

**AS SUPPLIED TO 600 PUBLIC HEALTH BODIES.**

The Sanitas Co., Limited, Bethnal Green, E.

## GRUNDY'S PATENT WARM-AIR VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.

### TESTIMONIALS.

"9 Victoria Chambers, Westminster, S.W.

"June 10, 1884.

"SIR,—I have much pleasure in testifying to the efficiency of your patent Warm-Air Fire Grate. It has been very successful, and given every satisfaction where I have used it.

Yours, &c.

"To Mr. Grundy. JAMES WEIR, F.R.I.B.A."

"Baptist Chapel, Clapham Common, London. Richard Webb, Pastor, 10 Grafton Square.

"February 15, 1884.

"DEAR MR. GRUNDY,—I have pleasure in testifying to the excellency and efficiency of your patent Fire-Grate. It is the most charming invention for heating a large room I have ever known. I shall have pleasure in showing it to anyone who wish to have their schools or rooms pleasantly and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool, July 1884.

"DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public.

"Mr. John Grundy."

From Hon. and Rev. G. G. C. Talbot, M.A., Withington Cheltenham.

"DEAR SIR,—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen.

"Mr. John Grundy."

From F. J. Yates, Esq., Architect, Birmingham.

"The best of the kind I have seen. I shall have pleasure in securing their adoption whenever opportunity offers."

Apply to JOHN GRUNDY, 80 Duncan Terrace, City Road, London.

Works—TYLDESLEY, near MANCHESTER.

**NOTICE OF REMOVAL.****BELLMAN'S PATENT GULLY.**

This Gully possesses the following advantages:—

Receives and disconnects one Rain-water Pipe and Three Waste Pipes.

Avoids all Splashing.

Forms Drain for Area or Surface.

Ventilates the Pipes and Trap. Is easy of Access for Clearance.

The ordinary P or S trap to be used in connection with Gully being in a separate piece, can be placed at any angle to meet the drain exactly, thus insuring a perfect joint, the Gully being fixed at right angles. This is a great advantage over other arrangements made with the trap in one piece.

The Holes for Rain-water Pipes are made both Circular and Square and of various sizes.

DESCRIPTIVE CIRCULAR ON APPLICATION.

THIS GULLY IS HIGHLY RECOMMENDED by Authorities on Sanitary Matters.

PRICE AT DEPOT:—EDWARD ST., DORSET SQUARE, N.W., 8s. 6d. each.

Also SINGLE GULLIES, for Sink Wastes only, price 3/9 each.

**BELLMAN & IVEY,**

# THE GREAT PROBLEM OF THE XIX<sup>TH</sup> CENTURY.

# VENTILATION WITHOUT DRAUGHT SOLVED.

The hitherto unsolved problem of "Ventilation Without Draught" is to be seen practically illustrated at FREDERICK HENRY SMITH'S Test Room, No. 63, 52 Queen Victoria Street, E.C., Patentee of the Automatic Siphonic Aspirator System of Ventilation. A personal inspection invited.

*Extract from the Annual Report of the "French Hospital and Dispensary," issued 29th January, 1885.*

We have also to return our best thanks to Mr. Smith, who undertook gratuitously to repaint one of our wards and to apply a new system of ventilation of his own invention, which was very successful.

*Letter from David Urquhart, Assistant Engineer to Colonel Sir Francis Bolton, C.E.*

F. H. SMITH, ESQ., 52 QUEEN VICTORIA STREET, E.C.

4 THE SANCTUARY, S.W., LONDON: NOVEMBER 22nd, 1884.

In reply to your inquiry, I have much pleasure in certifying that your system of ventilation as applied to the "Island Room" of the illuminated fountains at the Health Exhibition reduced the temperature during the displays from about 110 deg. to about 70 deg., and thus enabled the men to perform their duties without inconvenience.—Yours faithfully,

DAVID URQUHART.

*Extract from the TIMES of March 14, 1885, page 7.*

"VENTILATION WITHOUT DRAUGHT.—This desideratum appears to be accomplished by a syphonic system devised by Mr. Frederick H. Smith, at whose offices, 52 Queen Victoria Street, London, we recently inspected the arrangement. The air supply is conducted into the apartment from the external atmosphere by means of air ducts, which terminate in distributing passages at the floor level. The exit for the vitiated air is placed in the ceiling, and consists of two tubes, a large and a small one, running parallel to each other between the floor joists in the case of rooms having others over them. In the case of rooms on top floors, or those having the roof directly over the ceiling, the tubes are placed concentrically, but the action and results are the same. The larger of the two tubes carries off the vitiated air, while the smaller one forms an induction tube for cold air, its outer extremity being open to the atmosphere. These two tubes or conduits are so connected that the passage of the heated air through the larger tube induces a current of cold air through the smaller one in a continuous stream. The result is a rapid clearing away of all deleterious gases and products of combustion as they accumulate, and the preservation of a pure atmosphere at an equable temperature in the apartment. In a small room at Mr. Smith's offices in which five large gas-jets were burning, the atmosphere was apparently quite innocuous at the level of about 7 feet, the temperature being about 60 deg. Fahr. At a higher level, however, and especially near to the ceiling, the temperature was high and the air greatly vitiated. It was demonstrated that this vitiated air was being drawn off through the exit tube, which acted as a powerful sucker. After turning off the gas-burners, and upon the temperature of the room generally becoming lowered and equalised, a feeble upward action was still maintained in the upcast tube, but there was no down-draught whatever. The system has already been applied to a church and other buildings with acknowledged success."

**POWERS OF THE DEAN OF GUILD COURT.**

IN an appeal the Court of Session have decided that the Dean of Guild Court of the city of Edinburgh had jurisdiction within the regality of the Canongate, Edinburgh, and that the Dean of Guild had properly interfered to prevent the Edinburgh Gas-Light Company erecting new buildings on their own ground in the Canongate, without first having obtained a warrant from the Dean of Guild Court.

The Lord President gave the leading opinion, which was concurred in. He said:—The first of the two questions raised in this appeal was whether the Dean of Guild of the city of Edinburgh had jurisdiction within what was known as the regality of the Canongate, within which the works of the appellants were situated. He was willing to assume that prior to 1879 the Dean of Guild had no jurisdiction within the regality of the Canongate, and he thought the jurisdiction of the Dean of Guild in that district was conferred by the 124th section of the Act of 1879. The words were:—

“Such Court as so constituted shall possess and exercise within the burgh all the rights, powers, and privileges which are possessed and exercised by the existing Dean of Guild Court by law and usage within the limits of its present jurisdiction.”

Now, according to the contention of the appellants, the “limits of its present jurisdiction” were the burgh of Edinburgh as extended by the various Extension Acts, but not the regality of the Canongate. The term “burgh” was defined by the interpretation clause to mean the whole burgh within the police boundaries, and it was admitted, in point of fact, that the regality of the Canongate was within the police boundaries of the city of Edinburgh. With that light how did they construe that clause? The Court was to possess and exercise within the police boundaries of the city of Edinburgh all the powers, functions, and jurisdiction which were possessed and exercised by the Dean of Guild Court within the less extended limits of its present jurisdiction, which excluded the regality of the Canongate. Was there no extension of the jurisdiction then? and were there not two areas—an extended and a limited area, quite distinctly defined—one, according to the view of the appellants, excluding the regality of the Canongate, and the other including the whole burgh, meaning the whole area within the police boundaries of the city, which confessedly embraced the regality of the Canongate? It was impossible, therefore, to hold that the Dean of Guild had

no jurisdiction within the regality of the Canongate. The only other question was, whether the Gas-Light Company were entitled to go on under the powers of their Act of Parliament, to erect any building within their own ground without obtaining the usual warrant from the Dean of Guild Court. The statute which incorporated the Company undoubtedly gave them power to erect buildings from time to time. But every proprietor within the burgh had a right to erect buildings on his own ground subject to this, that he must, first of all, obtain a warrant from the Dean of Guild Court. He could see nothing in the power given to the Company which did not belong to other proprietors in Edinburgh. The Dean of Guild had, therefore, quite properly interfered to prevent the building in question going on until a proper warrant had been obtained.

**STONYHURST COLLEGE.**

THE extensive alterations and additions to this world-renowned Roman Catholic seminary, which were commenced nearly seven years ago, are now nearly completed, and its educational resources, for the improvement of which the enlargement was undertaken, are now felt to be quite adequate and efficient. When the alterations were projected, the college authorities found it necessary to make arrangements to pull down a considerable portion of the older part of the structure. The project involved enormous expenditure, but so many handsome offers of assistance were received, especially from old students, that the finances justified the commencement of operations sooner than was expected. The designs of Messrs. Dunn & Hansome, architects, of Newcastle-on-Tyne, which provided for 250 students, in addition to class and other rooms, were accepted, and the foundation-stone of the new portion of the college was laid on August 1, 1878, by Mr. Lomas, of Clayton Hall. The new south front of the college is 840 feet in length, including the returns, which join the centre block to the

wings; and this, added to the church front, gives a total frontage of upwards of 900 feet from east to west. A cloister, 80 feet long, connects the church with the west wing. In the latter are four corridors, in as many storeys, on the north side of the building, each 136 feet long by 8 feet wide, and having nine large rooms opening upon it. There is a staircase at each end of the corridors, and the roof of the building is flat and covered with Claridge's asphalt, providing, as in other portions of the new building, a convenient promenade. On the basement floor of the east wing is a drawing-school, 40 feet by 39 feet, and 13 feet high, and a gymnasium and fencing-room of the same dimensions, with rooms for music masters and music practices. In this wing, on the ground-floor, are three playrooms of large dimensions, for 60, 80, and 60 pupils respectively, all furnished with billiard-tables, chess, draughts, and other indoor games, and the walls are covered with pictures and photographs. On this floor also are two reading-rooms, and a cloister 440 feet long runs from the playrooms past the chapel (not yet finished) towards the church, and there is a similar but loftier one on the floor above. The east return cloister is 103 feet in length. Two magnificent oak staircases give access to the dormitories, which are very spacious, providing from 1,000 to 1,500 cubic feet of air for each boy. The staircases are of solid oak, with carved handrails and balusters, the steps are 8 feet long and 14 inches broad, fitted with Hawksley's patent treads. Above the playrooms is the Academy Hall, which is floored with oak. It is 93½ feet long, 40 feet broad, and 23½ feet high, and is considered the finest room in the college. It has a stage projecting 40 feet from the floor, with a gallery for the boys at the opposite end, having thirteen rows of seats. The ceiling of this magnificent apartment is elaborately decorated in the style of the Elizabethan period, and the walls are enriched with plaster and panel work. The study hall, in the centre of the new building, on the same floor, is 90 feet long by 35 feet broad, and 22½ feet high, and it has a plain oak wainscoting 6 feet high. Each boy has a handsome little desk of

plain polished mahogany, standing apart from that of his neighbour, and the seat has the tenant's name inscribed on a brass plate. There are twelve class-rooms right and left of the study hall, and the corridor giving access to them and the hall is 327 feet long, 14 feet wide, and 15½ feet high. The chapel will be in the ornate Perpendicular style, the gurgoyles Gothic, and the other details of the Queen Anne period. The height of the two central turrets of the new building is 110 feet 6 inches, including the nave (about 10 feet), whereas the two old Italian cupola towers of the west front are only 99 feet from the ground to the eagles, but they stand on an elevation 5 feet higher. With the exception of the chapel and some of the lavatories the whole work has been accomplished, and the structure now presents a noble and imposing aspect. The total cost of the alterations and additions has been estimated at from 100,000£. to 150,000£.

### MANCHESTER SHIP CANAL.

ON Tuesday Liverpool relieved itself of the charge of apathy regarding the proposed Manchester Ship Canal. The large meeting of the Chamber of Commerce in the Cotton Association's large room, and the unanimity of opinion there expressed afforded ample proof, says the *Journal of Commerce*, that Liverpool is alive to the importance of stopping a scheme which it was declared would turn out to be as great a disappointment as the South Sea Bubble. The President of the Chamber, Mr. E. Smith, dealt with the subject in a comprehensive manner, and his piquant arguments and his well-collated facts afforded a great amount of information. The president moved the adoption of the memorial, which had been prepared with much care and ability by Mr. Coke, and he adduced evidence showing the great necessity for the Chamber to oppose the Canal Bill before the House of Commons Committee. The passing of the measure might result in damage to the port of Liverpool which, once suffered to occur, could never be repaired.

He very easily disposed of the argument that the canal would cheapen freights, and from a commercial point of view he showed that the calculations laid before the Lords were altogether unreliable, and in some instances ridiculous. One specimen may be given. The promoters of the canal expected that the traffic on the waterway would amount to 9,469,000 tons, and yet the whole of the traffic from Liverpool by canal, rail or road only amounted to 9,864,000 tons. The exposure of this ridiculous evidence very naturally provoked considerable amusement. Mr. Coke supplemented the president's remarks by a forcible speech in seconding the motion. He explained the conditions under which the chairman of the Dock Board and Sir W. B. Forwood stated that Liverpool opposition to the Canal Bill might be withdrawn. Those conditions had not been observed in the measure now before Parliament. On the contrary, the Bill asked for such powers of interference with the estuary that the granting of them might bring about the destruction of the port of Liverpool. The memorial was then unanimously adopted, after which a resolution was proposed empowering the council of the Chamber to oppose the Bill and to call evidence. Sir W. B. Forwood, in seconding the motion, accounted for the apathy which had prevailed to the belief among the citizens that there was no probability of the scheme being sanctioned. He thought it was a great mistake for the people to have become impressed with the idea that the canal would not be made. If Parliament permitted dividends to be paid whilst the canal was in course of construction, the money would be, in a large measure, subscribed by small tradesmen in the country, and they would eventually learn that they had been supporting the greatest Bubble they had known since the South Sea bubble. The loss would fall on the poorer portion of the community. They did not find the men of light and leading in Manchester lending themselves to the scheme, for they knew that it could not be a permanent benefit to that city, but that it might do serious damage, not only to it, but to the port of Liver-

pool, by making it impossible for the great transatlantic ships to enter the river. The second resolution was carried unanimously, and a vote of thanks to the chairman closed the proceedings of a very successful meeting. In addition to the information afforded by the speakers to the members of the chamber, it may be remarked that the promoters of the scheme proposed to have docks at Manchester which will have 26 feet of water, and so permit the entrance of large vessels. The question arises, how is the large quantity of 26 feet of water to be maintained? If it can be maintained, it is clear that they mean to rob the Weaver, and so deprive Liverpool of a current which comes down to scour the channels of the Mersey and add strength to the current. This will have an injurious effect upon the channel and bar, because if the tides lessen in strength they must also lessen in scouring power. If the promoters have power to do what has just been pointed out, they may enclose the water, which would have a very damaging effect. Again, the gates at the entrance to the canal would have to be closed half an hour before high water, as the tide would recede, and the entrance must be kept clear of vessels to insure the safety of the canal. A similar precaution has to be taken at the south entrance of the Great Float, where there are only 144 acres of water to be dealt with, as compared with 400 acres in connection with the canal. The navigation both at the entrance to and in the canal will be very difficult. The chief loch will be 550 feet long and 60 feet wide, and the water will run into it at the rate of four knots an hour, and there will often be the danger of grounding to contend against. Besides, it must be remembered the great amount of small craft which large vessels would be continually meeting with. Already there are 28,841 vessels going in and out of the river in connection with the Bridgewater Canal, 12,655 in connection with the Weaver, and 8,191 in connection with Ellesmere Port. The dangers with these small craft would be greatly increased, especially after the large vessels entered the twenty-two mile portion of the canal, and the dangers would not be much less in navigating the 2½ miles previous

to entering the loch. Should a vessel get out of position she would go right across the island. Of the three lochs at the entrance, only one will be of any practical use for the ship canal, the other two being respectively 300 feet long by 40 feet wide, and 100 feet long by 20 feet wide, and useless for the class of vessels it is proposed to take up to Manchester. Now that the Chamber of Commerce has entered energetically into the opposition, it is most likely that new and important evidence will be given.

#### DECISION IMPORTANT TO BUILDERS.

THE following case came before Judge Bedwell last week in the Goole County Court, being a claim for 50% damages. Plaintiff (Henry Swann) is a builder and contractor of Goole, and the defendant (Henry Holtom) is an architect and lives at Bond Street, Dewsbury. Mr. Watson appeared for the plaintiff, and Mr. Ibberson, of Dewsbury, for the defendant.—Mr. Swann said that in the month of August 1884 he saw an advertisement in the *Goole Weekly Times* for the erection of a new co-operative stores for the Goole Co-operative Society. He got the contract, which was signed in Dewsbury on September 9 last year. Mr. Holtom, of Dewsbury, was the architect, and drew out the quantities, for which he charged 35%. He got the certificates from the architect, and he had received 625%. He did work to the amount of 241% before he asked for another certificate. He wrote for another certificate, and the architect came over and said he could not give him one. The 241% had nothing whatever to do with either plumbing or slating. The architect appeared to be refusing the certificate at Mr. Schofield's request to keep back money for slating and plumbing. The clerk of the works (Mr. Rd. Elliott) met the architect and himself at the railway station, and he (the architect) would not give him the 200% which he thought he was entitled to. He asked the architect for money, but he would not give him any, and he had to borrow money in order to pay wages. He saw Mr. Schofield on the Monday following

and asked for money, and as he declined, he stopped the work. He (Mr. Schofield) said he had not given him money because if he did have a draw he would stop the work. He subsequently received two sums of 20% and 25% from the Co-operative Society. He (witness) started on a new contract on the following Wednesday, and he was to be guaranteed work. On the following Friday he got 20%, and on the next but one he got 12% to pay 17% wages. He saw Mr. Everett, who had a consultation with the defendant, and ultimately they gave him (witness) 50% to close the contract. He accepted that as he was obliged to do something.—Mr. Watson said that it was the duty of his legal friend to prove that the plaintiff had not done his work in a workmanlike and proper manner, and there was, he believed, no allegation that he had not done his work in a proper manner. Mr. Swann was obliged to accept that 50% as the architect would not give him a certificate.—His Honour ordered a nonsuit in the case, as the plaintiff ought to have held out and not accepted the 50%.

#### PAYMENT FOR PLANS.

In the Scotch Court of Session, on May 29, before Lord Fraser, in the case of *Armstrong v. Cranston*, the record was closed and a proof fixed. This case has arisen out of a dispute regarding the payment of the architect's fees for the designing of the reconstructed Waverley Hotel, Princes Street, Edinburgh. The pursuer, an architect in Edinburgh, sues the defender, a well-known Edinburgh magistrate, and proprietor of the old Waverley Hotel, for payment of three separate sums amounting in all to 686*l.* 12*s.* 6*d.*—for services rendered by the pursuer in connection with the reconstruction of the hotel, 568*l.*; remuneration in preparing plans for stock-rooms and warehouses, 25*l.*; and account for surveys and measurements in connection with defender's claim against the Glasgow City and District Railway Company, 93*l.* 12*s.* 6*d.* The pursuer states that on the instructions of the defender he prepared the necessary plans,

specifications, and drawings, and made out the schedules of measurements or bills of quantity for, and superintended the erection and completion of, the present Waverley Hotel occupied by the defender; and that he was employed on the ordinary professional footing, and was entitled to charge the professional fee of 5 per cent. on the actual cost of the work done. The cost of the work under the original contracts was estimated at 10,031*l.*, but the defender made considerable additions and alterations during the progress of the work, which added largely to the cost, and the pursuer believed that the final cost of the portion of the original design now erected to be not less than 13,300*l.* Upon this amount the pursuer charges for his professional services as architect a fee of 4½ per cent., and claims to be entitled to remuneration in addition for preparing schedules of measurement from the contractors, and a fee at the completion of the works for measuring up the alterations. The pursuer states that the defender has not only refused to pay the sum in question, but has made unfounded allegations of negligence and unskilfulness on the part of the pursuer, and charges of professional dishonesty, for which he holds the defender responsible, and he specially reserves his claim against him for *solutum* and damages in respect thereto. The defender states that as the pursuer had only recently started in business in 1881, when the new building was projected, it was never contemplated by either party that a full maximum charge should be made for services to be rendered, and that various blunders made by the pursuer in his plans of the building had caused serious loss to the defender. The pursuer's measurements were further found to be inaccurate throughout, so that the contractors would not accept his reports for the purpose of assessing the amounts due to them, and the whole work had to be remeasured at the expense of the defender. The defender is, however, willing to pay 354*l.* 1*s.* 8*d.* in full of all claims, this sum being arrived at as follows:—Claim for Waverley Hotel, 598*l.*—less payments to account, 110*l.* 10*s.*, and sum received from contractors

by pursuer for measurements, 200*l.*, leaving 287*l.* 10*s.*; claim for workshops (admitted), 25*l.*; claim for Glasgow Hotel, 93*l.* 12*s.* 6*d.*, less struck off by auditor of Court of Session, 52*l.* 10*s.*, leaving 41*l.* 11*s.* 8*d.*

### THE SCIENCE AND PRACTICE OF VENTILATION.\*

By ROBERT BOYLE, Ventilating Engineer.

THE word "ventilation" is derived from the Latin word *ventilo*, to ventilate or to blow, and in its most ordinary signification implies movement of air with reference to the removal of impure atmosphere. Ventilation and health are so conjoined that it is impossible to consider the one without keeping the other in view. In this enlightened age we are fortunately becoming more alive to and appreciative of the laws of nature which govern and maintain health and add to our welfare and enjoyment of life. This is evidenced in a marked degree in the improved construction of our buildings, and the care and attention which are now bestowed on their hygienic arrangements by both architects and occupants.

This most desirable and satisfactory state of affairs has not, however, been arrived at without very hard work on the part of many earnest men, who have perseveringly pressed upon the attention of the public the necessity of pure air in their homes and halls for the proper maintenance of health, and their social, moral, and physical improvement. Without such men to lead the van and prepare the way practical sanitary science would have great difficulty in making headway, for before the people can be brought to accept the means of preserving health, they require to be educated up to and taught the necessity for doing so, and shown in a plain but forcible manner the important advantages to be derived thereby, and the injury and loss sustained by not giving heed to the

prescribed precautions. The names of Rumford, Franklin, Sutton, Hales, the Marquis of Chabannes, Morin, and Tredgold, along with many others, are well known to the student of sanitary science as those of men who did much to elucidate the difficult problem of ventilation, but, unfortunately for the speedy advancement of the cause, their efforts did not receive that recognition and encouragement at the time which they deserved. From the earliest times the necessity of pure air for the preservation of health and as a protection against disease has been known, and provision, of a kind, made to secure it. Varro mentions that Hippocrates preserved several cities in Greece from an epidemic pestilence by an arrangement of apertures in the dwellings, by means of which a constant through-draught and change of air were secured. Vitruvius, Pliny, Celsus, and Agricola also made a special study of the subject, the latter being credited with the invention of a system of ventilation by means of heat.

Sir Christopher Wren fully realised the importance of proper ventilation, and devoted considerable attention to the practical development of it, one of the buildings which he attempted, though unsuccessfully, to ventilate being the old Houses of Parliament. Desaguliers, Sir Humphry Davy, and many others also exercised their ingenuity on that building, but without any very satisfactory results. Dr. Boswell Reid's system, in spite of the objections raised against it, is certainly the most successful of the many plans tried.

Previous to the discoveries of Priestley, Schule, Seguin, and Lavoisier, the term "ventilation" had no definite and distinct meaning, at least such as is now attached to it. The great features which it presents might have been unfolded, but the chemistry of the numerous gases which have since been made known was a blank in the page of science. The experiments of Pottenkofer, Roscoe, and Péciot, have also reduced the subject to a measurable quantity, and brought the science of it within the grasp and comprehension of all who choose to study it.

### BLUNDELL'S PETRIFYING LIQUID

Is a preparation for interior use, for the cure of DAMP WALLS. It is made in two colours, White and Red. It is applied with a brush as easily as ordinary paint, and dries hard in a few hours with a glazed surface. The many uses of such an article are obvious. As an economical substitute for White and Red Glazed Bricks, for interior walls, it is most efficient. Applied over brick, cement, iron, or wood, for the walls of passages, kitchens, schoolrooms, hospitals, and charitable institutions, where CLEANLINESS is indispensable, it will be found invaluable, as the smooth enamelled surface offers but little hold for dirt, &c., and can be washed when necessary. Used over walls before papering, it prevents discolouration, and offers a surface to which the paper will adhere firmly. Economical in cost, simple in application, and efficient in use. The proprietors recommend it with full confidence. To be obtained of the leading Paint, Colour, and Varnish Dealers.

**BLUNDELL, SPENCE & COMPANY, LIMITED,**

Colour, Paint, and Varnish Makers, Oil Boilers and Refiners,  
HULL, and ANCHOR WHARF, 9 UPPER THAMES STREET, LONDON, E.C.

**DAMP  
WALLS.**

The evil effects of breathing impure air are now so generally known and admitted that it is almost unnecessary for anything to be said here to impress the fact further.

It may, perhaps, be as well, however, to mention that it has now been established, on the most incontestable data, that the majority of the diseases from which man suffers arise from preventable causes.

Their origin being clearly traced to the polluted air we breathe—"Statistical inquiries on mortality prove beyond a doubt that of the causes of death which are usually in action, impurity of the air is the most important. Individual observations confirm this" (Parkes).

The effect which is produced on the respiratory organs by impurities inhaled into the lungs has long been known. Ramazzini in the last century, and Thackrah fifty years ago directed special attention to this point. "Consumption is the disease which carries off a fifth or more of the persons born in Britain, owing no doubt to the changeableness of the external climate, but much more to the faulty modes of warming and ventilating the houses" (Arnott). This is corroborated by Galton, who says:—"The breathing of foul air, contaminated by the breath of other persons, appears to be the special agent which develops consumption and diseases of that sort."

Dr. Reid is still more emphatic in his denunciation of the evil effects of impure air. He says:—"After these (mental anxiety or defective nutriment) no other cause, at least in modern times, appears to have inflicted so great an amount of evil on the human race as defective ventilation. When the air is of inferior quality, the mental faculties are subdued and deteriorated in proportion as the body is oppressed by the vitiated atmosphere, pure air being not only essential for the proper development of the bodily frame, but also requisite for the due energy of the intellectual functions. . . . The ravages of consumption, and the extended catalogue of evils accompanying diseases of the organs of respiration, point out the vast amount of misery that might be obviated, and of death that might be prevented, were the

leading principles and practice of ventilation more generally understood. The number of individuals is comparatively small who are really aware of the magnitude of the evils arising from the respiration of vitiated air. It is not generally understood that in innumerable public and private assemblies, churches, theatres, schools, &c., an atmosphere is often breathed for hours continuously which is as foul and offensive, compared with the air that is congenial to the lungs, as the water of the Thames at London Bridge contrasted with a pure mountain spring. It is no exaggerated statement to affirm that the greatest scourge with which this and so many other climates are affected—viz., consumption—owes its origin more to ignorance of the laws of health connected with the peculiarities of exposure to alterations of air and temperature, and to the severity of local draughts, than to any disadvantages connected with the local state of the atmosphere which cannot be met with proper care and attention; that numerous other diseases, particularly catarrhs, rheumatisms, and pleurisies often spring from this cause; that a depreciated tone of mental vigour, as well as of bodily health, may in endless examples be traced to the same cause; that the most deadly plagues that have ever appeared have been aggravated, if not caused, by want of cleanliness and ventilation; and that the ordinary typhoid fever of this country almost invariably originates under similar circumstances. But, independent of the more serious and direct attacks of disease, there are numerous minor evils that often prey upon the constitution where the air is of inferior quality. The long-continued action of vitiated air gradually undermines the tone and strength of the stomach: the appetite diminishes, and the citadel or mainspring of the constitution being thus enfeebled or destroyed, all the other powers of the system also gradually give way. Nor are the moral and intellectual faculties to be forgotten in considering the influence of a vitiated atmosphere, as the energy and tone of both are lowered and depressed by bad air.

When the atmosphere is pure, and the system

free from disease, the air feels light and elastic, respiration is performed unconsciously, the mental faculties are serene, the bodily strength great, the appetite good, and the sleep calm and refreshing. But when the air is of inferior quality the respiration becomes uncomfortable, and often anxious or oppressive; the strength begins to fail, the general tone of the system is depressed, the power of bodily or mental exertion becomes impaired, the sleep anxious and uncertain, and, in extreme cases, where the air has been vitiated to a great extent, death rapidly ensues. In more minute proportions, impurities in the air produce an endless variety of discomfort and disease, sometimes inducing a sense of languor or debility that may barely be recognised; while, on other occasions, they undermine the constitution by a slow and insidious action, which is too often accompanied by a permanent loss of health. . . . The extreme extent to which disease, suffering, and death are produced by bad air and by offensive draughts and currents is well known in the medical profession. . . . Every one who has traced the insidious progress of that disease which counts its weekly victims, in the metropolis alone, by hundreds, is impressed with the power and influence exerted by impure and overheated atmospheres, particularly when the constitution is tried alternately with them and noxious draughts and local currents."

It was long contended by many, and is even at the present day by some—such is the perversity of human nature—that the proper place from whence to extract the foul air was at the floor level, the contention being that the carbonic acid gas exhaled from the lungs, owing to its being so much heavier than common air, immediately falls to the ground, and lies there and accumulates unless it is drawn off.

Now this would be all well and true if it referred to carbonic acid as a separate and distinct gas; but there has not been sufficient, or indeed any, allowance made for its admixture with the air which is expelled from the lungs, or its highly rarified state, rendering it for the time being lighter than ordinary air. Its natural course, under these conditions, is to ascend;

and it will continue doing so until it comes into contact with some cooling body, when it is reduced to its normal state and diffuses itself in the atmosphere of the room, unless provision is made for drawing it off. It is a common error to suppose that carbonic acid gas tends to descend to the floor of any apartment in which it may be evolved by respiration or combustion. In all cases where carbonic acid has once mingled with a considerable proportion of air, as in the processes of respiration and combustion, it does not again separate from the gases with which it may have been blended, in consequence of its specific gravity. If, then, the vitiated air be removed by an opening above, it will be carried away with the least chance of contaminating the remaining atmosphere; whereas in apartments where the air is withdrawn at a low level, and the usual temperature maintained, the products of respiration must perpetually tend to return upon the body from which the air has been expired.

"In this country, air vitiated by respiration tends invariably upwards; the products of combustion follow a similar course; hence an ascending movement should be given accordingly to the air. The ascending movement is also the natural system. It may be assumed, then, that a system which is not only in unison with the laws of nature, but also that which almost universal experience dictates, may be safely followed as a guide in leading us to give a decided preference to ascending movements" (Reid). To quote other authorities, Sir James Clarke says:—"The pure air should enter below and the deteriorated air escape from above." While Professor W. T. Brande states that, "In the ventilation and warming of buildings there are two essential points to be kept in view. First, the free escape of the warm air from above; and secondly, the admission of a compensating quantity of fresh air from below." Dr. Ure also condemns the downward circulation:—"The downward circulation of air every sound physiologist will deprecate as a noxious fallacy."

It must be confessed that there is considerable diversity of scientific opinion with

respect to the quantity of air a man consumes, the extent to which it is vitiated by respiration, and the quantity of air per head which is necessary to secure efficient ventilation. Vierordt states that a man makes 16 respirations per minute, the volume of air expired each breath being 30.51 cubic inches, which gives 480 cubic inches expired per minute, and the quantity of carbonic acid contained in the expired air 4.6 per cent. Tredgold gives the number of respirations as 20 per minute, the volume of air inhaled each respiration being equal to 40 cubic inches, giving 800 cubic inches as the volume per minute which is expired from the lungs after use. Dr. Reid also gives the number of respirations as 20 per minute, but fixes the volume of air inhaled each respiration at 16 cubic inches. He likewise states that it may be assumed that a man consumes oxygen amounting to 10 per cent. by volume of the air inspired, and discharges 7.8 per cent of carbonic acid gas.

Pettenkofer's and Dr. Angus Smith's experiments lead me to the conclusion that if the figures given by the above authorities are averaged, the result may be then taken as fairly correct. "Each cubic foot of gas burnt per hour may be assumed, upon an average, to vitiate as much air as would be rendered impure by the respiration of an individual" (Galton). A common small gas burner will burn nearly 3 feet per hour. With regard to the quantity of air that should be supplied for each person, there is even a greater diversity of scientific opinion.

The amount necessary is variously fixed at 150 cubic feet per hour (Vierordt), up to 3,000 cubic feet per hour (Parkes); but I think that the cubical contents of the room, the number of people occupying it, and the nature of their occupation, have a good deal to do with determining the amount of ventilation for change of air necessary, and this can only, with any degree of accuracy, be determined by examining and treating each building separately and according to its requirements, just as a doctor would treat a patient according to his specific complaint. Richardson says:—"The

aid of practical experience is called upon in behalf of every building at all distinct from the generality; and practical men must be consulted where any difficulties are likely to arise." It should always be borne in mind, however, that there are no hard-and-fast rules which govern the exact mode and determine the extent of the ventilation of a building. Ventilation is of necessity a very elastic subject, and to be successfully grappled with it must, to a certain extent, be treated broadly; no narrow or contracted ideas—which are, unfortunately, too common—can ever assist in advancing or raising it to that honourable position amongst the sciences which it is so justly entitled to occupy.

It being now generally allowed that the proper place from whence to extract the vitiated air is the highest part of the room, and that the supply of fresh air should be introduced at the lower part, it may be useful to the reader to know what appliances have been tried to effect this, and which have been found to answer the purpose best. It would be quite impossible, within the limits of this article, to describe all the contrivances which have been brought out from time to time, as their name is legion, so I will confine my remarks to a description of those methods of ventilation which are best known and representative of their class.

The different methods may be divided under four headings. First, ventilation by a plenum movement, that is, when air is forced into a building at a high velocity by means of fans or water-motors. Second, by a vacuum impulse, the air being exhausted out of a building by mechanical means, or the action of the external atmosphere. Third, by a mixed movement, being a combination of the plenum and vacuum movements. Fourth, automatic or natural ventilation.

The principle of the plenum system is to secure a strong pressure of air inside the building, and so force the foul air out through any openings that may be provided—doors, windows, &c.—and at the same time prevent draughts from passing in through them. This system

# THE "HARDING" VENTILATING COMPANY,

30 EAST PARADE, LEEDS.

## HARDINGS' PATENT AIR DIFFUSER FOR VENTILATING ALL KINDS OF BUILDINGS.

MR. T. PRIDGIN TEALE, F. R.C.S., M.A., Surgeon to the General Infirmary at Leeds, says of Hardings' Diffuser in his book called "Dangers to Health":—"I am satisfied that by means of this apparatus, we can secure in a town freshness of atmosphere, absence of draught, and exclusion of dirt."

The fresh air is conducted through a grate and aperture in the wall, as shown on section, about 7 feet 6 inches above the floor level; it is then conveyed through the filter, and passed into the room through a series of small tubes placed at an angle of about 30 deg. with the wall.

By these means the currents of air rushing into the apartment are compressed whilst passing through the tubes. The currents of air, as soon as liberated, expand, cut into, and break each other up, and diffuse in all directions so effectually that no draught or chilly sensation can possibly be experienced by the occupants, and at the same time a large volume of pure air is constantly being admitted and dispensed evenly through the apartments.

**CHURCH WALL VENTILATOR.**—As used in the ventilation of Archbishop Zouche's Chapel, York Minster.

The DEAN OF YORK, with reference to the ventilating of Archbishop Zouche's Chapel at York Minster, says:—"I think the ventilation is perfectly successful, and all I have spoken to about it are well satisfied with it, and much pleased with the result."

**OUR PATENT EXTRACTOR** is the best in the Market, and is supplied at a very much lower price than any other.

**CHURCH WINDOW VENTILATOR.**—These Ventilators are used for Churches, Chapels, and other Public Buildings where it is not desirable to have holes cut through the walls to admit air in the usual manner. The appearance is not more noticeable than the ordinary Hopper Ventilator so frequently seen.

"GENTLEMEN,—I have pleasure in stating that in my opinion your system of ventilation, introduced in our Church this summer, is a decided success. Heretofore when the Church has been well filled at the Evening Service, I have been almost exhausted by the effort of speaking before I have got half through. On Sunday night, October 7, at our Harvest Thanksgiving, we had a very large congregation, and I preached without the least feeling of weariness or exhaustion. I shall be glad to hear that your Air Diffusers are being widely adopted.—I am, yours truly, JOHN GREGORY, Minister of Oak Road Congregational Church, Leeds."

These Ventilators are more suitable for Schools, Warehouses, and other Buildings where cheapness is an object. The result is precisely the same as in our other styles, at a very much smaller cost.

A reduction in price is made where a number of Diffusers is required.

Estimates and further information given on application to the "HARDING" VENTILATING CO., 30 East Parade, Leeds.

Air Extractor.

has not, however, proved a success, and is disapproved by a number of the highest authorities. It is applied to Madison Square Theatre, New York, and at a meeting recently held at the Royal Institute of British Architects, that theatre was pronounced by a member, during a discussion on ventilation, to be the worst ventilated theatre he had ever been in.

It is claimed by the advocates of the plenum movement that a dense atmosphere is supposed to be more advantageous than that which is comparatively attenuated. This is a pure fallacy, however, and contrary to the laws of nature, which fact in itself is a sufficient condemnation of the system. Dr. Reid, referring to it, observes, "It is not unfair to conclude that the pressure which actually obtains at the surface of the earth must be considered the best for the maintenance of health and strength, both of body and mind. Those who advocate plenum ventilation too frequently trust entirely to the machinery with which the air is supplied, both for its introduction and subsequent expulsion. Few circumstances contribute more to produce dissatisfaction in ventilating arrangements." Galton says, "Theoretically, the propulsion of air into a room would expel all the foul air through the cracks of windows and doors, and the existence of pressure in the room would tend to prevent draughts of cold air from doors and windows; but in practice, in the ventilation of hospital wards, the system of propulsion, i.e., forcing the fresh air into the room, and allowing the vitiated air to find its way out, has not been generally found successful as a means of purifying the air. The air forced in seems to seek the first place of escape when circumstances allow of it. It will be found simpler to dispense with propulsion, and to rely upon the action of extraction shafts to draw in the air required through adequate channels provided for the ingress of fresh air." The New Law Courts are ventilated on the plenum principle, and the state of the ventilation in those buildings is notorious. The judges and others who have occasion to occupy the Courts are constantly complaining, through the press and otherwise, of the intolerable draughts

which are found in one part of a Court, and the stifling and foul atmosphere which exists in another part. This, it may be mentioned, is the common experience wherever the plenum method of ventilation is used.

Vacuum ventilation consists in exhausting the air out of a building either by mechanical means, expansion induced by heat, or by extraction shafts fitted with automatic ventilators, the diminished pressure arising from the expansion of the air within making it give way before the pressure of the external air. Air rushes into an apartment only when there is a want of resistance. If the air in it be not drawn out, none can enter of itself. In mixed ventilation, both the plenum and vacuum movements are brought into action, the supply of air being artificially forced in, and exhaust ventilators used for the extraction of the foul air. So far as the mode of admitting the air is concerned, the same objections apply to it as to the plenum system, and it is therefore not to be recommended.

Automatic or natural ventilation has proved more universally successful than any artificial method that has ever been introduced. This is to be accounted for by the fact that nature has made ample provision for its own support and well-being, and it only remains for us to give it a chance to assert itself by permitting it to heat the artificial structures in which we live and congregate in the manner it finds most in accordance with its laws, we of course assisting it according to our lights, and utilising its force in such a manner as to derive the greatest amount of benefit and comfort possible. The following are amongst the many advantages which the automatic has over mechanical ventilation. It is entirely self-acting; has no mechanical movement to get out of order; requires no attention to keep it in action, so that the ventilation of a building can never suffer through the machinery breaking down or the neglect of the person appointed to look after it, as is almost invariably found to be the case where mechanical systems are used; it is easy of application to any existing building; is much less expensive to apply, and the first cost is the

last, there being no after-expense necessary to keep it in operation, as with machinery, water-power ventilators, and systems depending upon heat for their action. In the application of the automatic system to a building, exhaust ventilators of the "Air-pump" ventilator type are fixed on the roof at the highest point, so as to permit of the wind getting at them freely from all points. Shafts connect the ventilators with the interior of the building, and may be fitted, if desired, with regulating valves. For the admission of fresh air, vertical inlet tubes or brackets are placed round the walls, and communicate with the outer air by means of holes cut through the walls. The size of the building, and the purpose for which it is used, determine the size and number of extractors and inlet tubes required. To make ventilation useful, it must act at all times spontaneously. Any call upon attention, even such as the opening of windows or their regulation in a particular manner, will be apt to be neglected. This is one of the chief causes of the many failures where mechanical or other systems requiring attention have been used.

(To be continued.)

### STIRLING WATERWORKS.

A NEW reservoir just completed is the largest of the series in connection with the Stirling Waterworks. The greatest length of water-surface measured in a straight line is 770 yards, or 110 yards less than half a mile. The full water area extends to 23,097 acres. The greatest depth of water is 59.4 feet, the mean depth 19.3 feet, and the total capacity is 121,540,710 imperial gallons. The old reservoirs—Nos. 1, 2, and 3—contain in all 64,081,620 gallons, so that the storage capacity of all the reservoirs is now 185,622,330 imperial gallons, and may be taken at 253 days, or 8.2 months' supply, which is, and which will no doubt be, a first-class supply for many years to come. The new works, which have been upwards of three years in progress, are expected to cost about 20,000*l*.

## THE HISTORY OF ART.

In Two Plates, reproduced from the Splendid Painting around Cupola in Place St.-George's, Paris.

By M. FRANCOIS EHRMANN.

Showing Typical Figures of Ancient and Modern Styles of Art.

Size, Thirty-six Inches by Fourteen Inches.

Price One Shilling.

Free by post, carefully packed inside patent roller, One Shilling and Threepence each.

## AN IDYLL.

By ALBERT HYNNAIS.

A BEAUTIFUL TINTED INK PHOTOGRAPH.

Size, Nineteen Inches by Fourteen Inches.

Price Sixpence.

Free by post, carefully packed inside patent roller, Eightpence.

## THE GUITAR PLAYER.

From the Painting by Charles Sprague Pearce.

Size, Nineteen Inches by Fourteen Inches.

Price Sixpence.

Free by post, carefully packed inside patent roller, Eightpence.

## THE TRIUMPH OF JULIUS CÆSAR.

By ANDREA MANTEGNA.

FROM THE CARTOONS IN HAMPTON COURT PALACE.

Each Forty-two Inches by Fifteen Inches.

Price the Set of Two, Two Shillings.

Free by post, carefully packed inside patent roller, Two Shillings and Threepence.

## THE CLEMENCY OF SCIPIO.

By GIULIO ROMANO.

FROM THE PAINTING IN THE NATIONAL GALLERY.

Size, Thirty-two Inches by Fourteen Inches.

Price One Shilling.

Free by post, carefully packed inside patent roller, One Shilling and Threepence.

## ARCADIA.

By P. P. PRUDHON.

Size, Nineteen Inches by Thirteen and a half Inches.

Price One Shilling.

Free by post, carefully packed inside patent roller, One Shilling and Threepence.

May be obtained from all Newsagents or Booksellers, or from the

PUBLISHERS, GILBERT WOOD & CO., 175 STRAND, LONDON, W.C.

# "THE PEDESTAL VASE," JENNINGS' IMPROVED W.C. APPARATUS

(Combination Urinal and Slop Sink).

Registered No. 16,300.

A PORCELAIN VASE set on a tiled or mosaic floor, within walls or a dado of glazed tiles. The usual wood framing, forming a storehouse for the retention and accumulation of *damp, dirt, and disease germs*, with the joints, crevices, and imperfections in work which the closet enclosure so often conceals, is entirely abolished. The seat is hinged, permitting free access for use as a *slop sink* or *urinal*, and for cleansing, so that the entire apparatus and space can be freely washed down. For this latter purpose the floor should be slightly sunk, and laid to fall to a grating, with waste carried through the external wall, and terminating in a copper flap valve to prevent draught.

The suggestions as regards wall linings and floor, may, of course, be modified as best adapted to the building in which the closets are used; and in the consideration of such details, alternative schemes will readily present themselves.

At the recent **HEALTH EXHIBITION** (South Kensington, 1884), amongst a series of official tests, under the supervision of Baldwin Latham, Esq., C.E., and the Jury No. 9, Class XXIII., and successfully withstood by this closet, the following may be cited in evidence of its efficient action. Being fixed in position shown in illustration, with "**JENNINGS' PATENT SINGLE FLUSH WASTE-PREVENTING SYPHON CISTERN**" 5 feet over, with 1½ inch down pipe, ten apples (averaging 1½ inch diameter) and a flat sponge about 4½ inch diameter were thrown into the basin. The water, as well as the whole of the exposed or dry surface, was first blackened with plumber's "smudge," and the sides covered by four pieces of thin sanitary paper, which adhered closely to the soiled surface. The handle of the cistern was then pulled, and the two-gallon flush liberated. After seven seconds (the time occupied by the discharge), a receiver placed under the trap outlet was removed, containing in the blackened water the ten apples, the sponge, and the four pieces of paper, no traces of the soil remaining visible upon any part of the apparatus.

**GOLD MEDAL AWARDED.**

THESE CLOSETS are already in use in Hospitals, Banks, Hotels, Offices, Private Residences, &c., with most satisfactory results, and, fixed in the manner described, in appearance and action leave nothing to be desired. By the novel arrangement of the supply to Basin, as shown in the sectional sketch annexed, the whole surface is well flushed and cleansed, whilst the bottom of Basin and Trap are thoroughly scoured by a concentrated rush of water which insures the **instantaneous removal** of the contents, thus overcoming the inherent defects in the many imitations recently produced of "**JENNINGS' MONKEY-CLOSET**" (the original form of wash-out watercloset), which was invented and patented by G. J. in 1852.

## GEORGE JENNINGS,

SANITARY ENGINEER, STANGATE, LONDON.

A VISIT TO THE SHOWROOMS IS RESPECTFULLY REQUESTED.

S.E.

## CASES FOR BINDING THE ARCHITECT,

Price Two Shillings.—Office: 175 Strand, London, W.C.

# EASTWOOD & CO. (LIMITED).

## LIME, CEMENT, AND BRICK MANUFACTURERS.

**SHOEBURY, COWLEY, & KENT BRICKS IN ANY QUANTITY DELIVERED ALONGSIDE.**  
 Shoebury Malm Facings and Paviers. Dutch, Adamantine, and Red English Laths, Plaster. Lathing in the best style. Ridge Tiles, Terminals, &c.  
 Stourbridge, Welsh, and Newcastle Fire Bricks, &c. Red and White Suffolk Bricks. Moulded Bricks of all kinds. Staffordshire Blue Bricks.  
 Glazed and other Drain Pipes. Greystone, Blue Lias, and Chalk Lime. Red, White, and Black Rubbers. Chimney Pots, Slates.  
 Broseley and Yorkshire Roofing Tiles. Hair, Sand, &c. &c.

## PORTLAND CEMENT

(WELLINGTON BRAND) of Unsurpassed Quality.

Sole London Consignees of Messrs. Gibbs & Co.'s (West Thurrock) **PORTLAND CEMENT**, and the **LUMLEY GLAZED BRICKS**.

R. A. ALLEN & SONS well known Red and White Suffolk Bricks, and the Chemical Paper Company's (Limited) Water Damp, Wind, & Dust Proof Paper.

**BRICKFIELDS:—WEST DRAYTON, MIDDLESEX; SITTINGBOURNE, KENT.**

**WHARFS:—**

 BLACK HORSE LANE, RICHMOND; and

LEA BRIDGE WHARF, CLAPTON.

# The Architect.

## THE WEEK.

M. HÉBERT has accepted the direction of the French School in Rome. In consequence M. GUSTAVE BOULANGER has become the principal professor and chief of the section of painting in the Ecole des Beaux-Arts. The appointment of M. BOULANGER will have an influential effect upon the success of the school. He represents what can be done by the teaching there. M. BOULANGER was one of the pupils of PAUL DELAROCHE. In 1849 he won the Prix de Rome, and between that time and 1882, when he gained a chair at the Institute, M. BOULANGER has had a full share of the rewards which are to be gained in France by genuine men. He is equally competent whether he paints pictures of ancient Rome, modern Algiers, or undertakes decorative works. In a post like that of *chef d'atelier* character is of even more importance than ability. Fortunately for the students they have now over them a man who possesses a reputation for generosity, frankness, and urbanity, and who is endowed with a courage that is equal to maintaining the interests of the school on all occasions. As a critic he is most severe on his own works. M. BOULANGER holds England in esteem; he admires the works of English artists, and students who care to come to Paris may be confident of securing not only the best of teaching, but a hearty welcome in the Rue Bonaparte.

A GREAT improvement has been effected at the rooms of the Institute of Architects by the introduction of electric light, and it was first used on Saturday last with entire success. The failure of the light on Monday evening before the proceedings commenced was one of those accidents which cannot be foreseen, and was due to no negligence. But trifling inconvenience could have been caused, as the light was reinstated at an opportune moment. Sir COURTS LINDSAY is constructing the necessary apparatus at the Grosvenor Gallery, which before long will be in working order. Pending its completion a temporary engine in the courtyard behind the building is used for supplying the gallery, and also the Institute, by a connection which, in its circuit, supplies two other establishments in the neighbourhood. In the new apparatus all contingencies will be provided against, and the breaking of a driving belt, as happened on Monday night, would not matter. In finished machinery breakdowns are always largely allowed for. For instance, in lighthouses the failure of all the reserve engines would not cause more than a brief suspension of light. Matters are so managed that by a comparatively short and simple operation the mineral oil apparatus slides into position, and replaces the carbon apparatus.

THE Prefect of the Seine has selected the following works from the Salon for this year's purchase on behalf of the Municipal Council of the City of Paris:—Paintings: *Le Val à Villerville en juin*, by M. EUGÈNE BOURGEOIS (1,500 frs.); *Vue de Paris*, by M. A. CASILE (2,000 frs.); *Paris, Port de Mer* (the basin in the gardens of the Tuileries), by M. LUIGI LOIR (3,000 frs.). Sculpture: *Respublica Gallorum*, plaster, by M. COUTAN (4,000 frs.); *Lulli Enfant*, plaster, by M. GAUDEZ (5,000 frs.); *Giotto*, marble, by M. GUGLIELMO (8,000 frs.); *Au Loup*, plaster, by M. HIOLIN (5,000 frs.); *Horde de Cerfs*, plaster, by M. LEDUC (5,000 frs.). It will be seen that, in spite of financial difficulties, eight works have been acquired.

HER MAJESTY has been graciously pleased to accept the dedication of Mr. ERNEST LAW'S "History of Hampton Court Palace and Tudor Times," which will be published early next week by Messrs. BELL & SONS, of York Street, Covent Garden. Amongst the many places of interest that lie within easy reach of London, there is none, except Windsor Castle, that can be held to vie in historic charms with the Queen's magnificent palace at Hampton Court. Yet, strange to say, no one has hitherto been found to investigate and chronicle its past; and its

architecture, which is particularly characteristic of the Tudor period, and in many points most unique and instructive to the student of ancient manners, has been almost entirely overlooked in books where these topics are treated of.

To supply this deficiency, Mr. LAW offers his contribution in the shape of a work consisting of 400 pages, which should prove of much interest, the illustrations, numbering 130, being intended to form a special feature. These are composed of autotypes, typo-etchings, and lithographic and engraved plates. The autotypes have been executed by the Autotype Company, from negatives specially taken for this work, after five of the most interesting historical pictures at Hampton Court Palace, by HOLBEIN and other artists.

AMONG the chief topics dealt with are WOLSEY's private life at Hampton Court; anecdotes of him and HENRY VIII.; his building and decoration of the palace; his banquets, masques, and balls; his furniture, tapestry, and plate; his household and retinue; and his entertainment of ambassadors. HENRY VIII.'s domestic life at Hampton Court is also fully described, anecdotes being given of him, ANNE BOLEYN, and JANE SEYMOUR, and the following events narrated:—The birth and baptism of EDWARD VI.; the death and burial of JANE SEYMOUR; the marriage and arrest of CATHERINE HOWARD; and the apparitions of the ghosts of JANE SEYMOUR, CATHERINE HOWARD, and EDWARD VI.'s nurse. Under the reigns of EDWARD VI. and Queen MARY there are accounts of, among other events, the putting of Hampton Court into a state of siege by the Protector SOMERSET; the honeymoon of MARY and PHILIP II.; MARY's reconciliation with ELIZABETH, &c. To Queen ELIZABETH's life at Hampton Court five chapters are devoted.

IT is proposed that M. DE LESSEPS should be appointed President of the Commission for the International Exhibition, which is intended to be held in Paris in 1889. The name of the pioneer of the Suez Canal is so universally respected that with such a President the project would no longer be considered as a revolutionary glorification. Many countries may not applaud all that was done in 1789, although willing to take part in a peaceful competition in art and industry. With M. DE LESSEPS as president, there would be a guarantee that nothing would be done in connection with the exhibition which would prejudice international interests. It is true he has to bear the weight of many years, but at the present time he is possessed of the energy of youth.

A CURIOUS account was given by Mr. R. S. CLOUSTON at the meeting of the Scottish Society of Antiquaries of the exploration of a chambered cairn of the Stone Age, situated on a point of land jutting out into the Loch of Stennis, at Unstan, Orkney. The cairn contained an oblong central chamber, sub-divided into several compartments by large flag-stones set on edge. The chamber measured about 21 feet in length by about 5 feet of average width, with a small side chamber opening off the back. The passage leading from the chamber to the exterior of the cairn retained its roofing stones for 11 feet of its length, but the roof of the chamber itself had fallen in. Out of an immense quantity of broken urns discovered five have been reconstructed. They are broad, shallow, basin-shaped vessels, with round bottoms and vertical or slightly-projecting rims, presenting a striking contrast in their forms, and the hard, close-grained texture of their material, from the deep, flower-pot shaped vessels of the Bronze Age.

THE late M. GALIGNANI was one of two brothers who made a fortune in Paris through the patronage of English and American visitors. When he resolved to bequeath a vast sum of money for charitable purposes, he selected Paris rather than New York or London to be the recipient. The conditions of the will have been considered by the Municipal Council, and at the meeting on the 5th inst. it was resolved to appropriate a part of the money to the erection of a *maison de retraite* in the Boulevard Bineau at Neuilly. The work will cost about 60,000*fr.*

## THE CONGRESS OF FRENCH ARCHITECTS.

THE thirteenth congress of the Société Centrale des Architectes began on Monday in Paris, and has been continued during the week. By the permission of the Government the meetings have been held in the building of the Ecole des Beaux-Arts. On Monday and Tuesday the members assembled in the theatre, which is adorned with the famous "Hemicycle" by DELAROCHE, and the picture of *Romulus overcoming Acron*, which was painted by INGRES in 1812. The meeting on Wednesday was in a different room, in order that more space could be available for the exhibition of plans and models. The attendance was large. England was represented by Mr. R. P. PULLAN, who came over accredited from the Royal Archaeological Institute. The selection was especially appropriate for the occasion, inasmuch as Mr. PULLAN was the *collaborateur* of M. TEXIER, and worked in the same fields in the east with the French archaeologist. He was received with respect, and honoured with a seat beside the chairman.

The proceedings on Monday were opened with an address by the president, M. QUESTEL, who has been a member of the Institut for fourteen years, and is vice-president of the General Council for Civil Buildings. It was brief but to the purpose, and throughout the proceedings the chairman evidently desired that more prominence should be gained by others instead of by himself. A good deal of routine business had to be gone through, which devolved on the secretary, M. PAUL WALLON, who must be an administrator of the first order, for he was able to insure that the business of the week should be gone through without a hitch. Then an endeavour was made by a member to read a paper which was not set down in the programme, but when the matter was referred to the meeting there was an unanimous decision in favour of adhesion to the arrangements. It may be remarked here that the papers were read by the writers while seated at a table, which is a more comfortable arrangement than is adopted in England, although it may be less suggestive of the orator.

The first paper was read by an architect with a name that may be called English, M. LEOPOLD HARDY. The subject was one which is always interesting, although most difficult to treat, being a review of the present condition of architecture in France as it is illustrated by the designs in the Salon. M. HARDY is not an exhibitor this year, and while he endeavoured to be impartial in his criticism, he was not afraid to be outspoken. He raised a similar objection to what is heard in respect of the exhibition of the Royal Academy, namely, that too large a portion of the wall space has been assigned to students' works and drawings of old buildings. M. HARDY does not believe in the advantage of re-exhibiting designs in the Salon which have been prepared for public competitions, and he is far from satisfied with the accepted design for the Gambetta Memorial, of which there are nine views in the Salon. Architecture that is at once rational and ideal is, according to M. HARDY, not much in vogue at the present time in France. He advocated utility as a principle, advising his hearers that the arrangements for occupation should form their first consideration when planning a building, then the requirements for service, and that decoration should be thought about when those points were settled satisfactorily. But in respect of façades and ornamentation, M. HARDY expressed regret at the too rigid adherence to ancient forms and processes. They had all been nursed, he said, in Classicism, but truth alone was deserving of their affection, and the motto of the architect should be "*Amicus Plato, Magis amica veritas.*" In all this there was a strong resemblance to one class of English papers which may be heard at meetings, and to a visitor there was an attraction in the familiar thoughts. In cases of the kind the question is proposed by the Sphinx, but where is the answer. From the days of the jesting PILATE, how often has the question been asked, "What is Truth?" and in no department of life is an answer more difficult than in building.

After the meeting there was a visit to the printing-office, where the transactions of the Society are put in type. But none of the Paris houses can compare in size or in completeness of machinery with the larger printing-

offices in London, such, for instance, as that belonging to Messrs. SPOTTISWOODE & Co.

The proceedings on Tuesday began with an early visit to the Louvre, which attracted a very large crowd. Visitors to the sculpture galleries during the past year or two will remember that they were unable to see all the rooms. Works were in progress, and, in consequence, it was considered necessary to alter the positions of the figures. The *Venus of Milo*, for example, which is the crowning glory of the museum, had to be shifted from the end of the gallery to a place at the side. It was those works which M. GUILLAUME had undertaken to describe, and the knowledge which was abroad that many archaeological discoveries had been made was enough to collect architects from all parts of Paris. M. GUILLAUME had prepared a paper, but he afterwards changed his mind and adopted a less formal manner of discourse. Two of the great Roman lavabos were filled with large photographs and plans, on which every fresh discovery had been recorded, and by their aid M. GUILLAUME was able to explain all that had been revealed.

Every one who has read a guide-book to Paris is aware that there was on the site an older building than that "Old Louvre" which PIERRE LESCOT designed. The word "louvre" is supposed by some to come from "lupara," a forest, in which one of the early kings ordered a house to be built for himself and his attendant hunters, just as shooting-boxes are now raised in Scotland. PHILIP AUGUSTUS, in the end of the twelfth century, erected a castle here to gain control over the Seine, and from that time until FRANCIS I. grew tired of Gothic donjons and threw down the walls, the Louvre was a royal residence. In the alterations in the sculpture galleries it was necessary to make provision for heating, and the floor was accordingly removed. To the surprise of the architect and contractors Mediæval masonry was found underneath. A careful examination was made, débris was removed, and it is now possible to see beneath the galleries a most interesting substructure. On Tuesday the place was lighted by candles, which were held by attendants, and probably it can only be visited under special conditions. It is evident, from the columns and the remains of groins, that there was a great hall on the site, and judging by the masonry it may be considered to have been erected in the thirteenth century. There have been many alterations about the Louvre in the course of six centuries, and although it is now so much below the ground level, the floor of the hall may have been a few feet above the level of the Seine. A large circular opening suggests an oubliette, and recalls the legends of the Tour de Nesle on the other side of the river, which has been supplanted by the respectable building of the Institut de France. The discoveries by M. GUILLAUME have been described by him in some of the archaeological transactions, and he has informed us that he is preparing another work on the subject. The visit to the subterranean Louvre excited the greatest interest, and by itself was enough to make this week's congress memorable.

The thirteenth century appears quite modern if compared with the period of which M. LEDRAIN afterwards spoke. The Assyrian Gallery in the Louvre, which contains the colossal sculptures which M. BOTTA secured, has been enriched by several incomplete figures which have been carved out of a dark grey stone that seems almost as hard as basalt. They stand in front of the winged bulls and the muscular heroes who strangle lions as if they were kittens. From their unassuming appearance, they are likely to be passed with a shrug by the ordinary sightseer. But for an architect, there is no work of a sculptor's hand which possesses more interest. The fragments represent the architect-kings of primitive Chaldea. M. FELIBIENS, when writing the lives of famous architects, endeavoured to gain the support of LOUIS QUATORZE and the Court for the art by explaining its regality of character, since the first architects were kings. Such wonderful assertions were to be found in the dedications of those days, we may assume that if any fine gentleman condescended to open the book he accepted the statement as a specimen of grandiloquent conventionalism. But two centuries afterwards there is the Mission de Sarzee, several broken statues are exhumed, and it is now made plain beyond a doubt that the kings or chiefs of the Eastern land were so proud of their architect-

tural knowledge that it was the fashion to represent them with a sort of slab upon their knees, on which a plan of a building was accurately engraved, and with a scale to correspond. To what extent they represent the truth we need not inquire. The sculptor's art must have ceased long since if it had not been based on flattery. LOUIS XIV. did not single-handed frighten river deities, kill lions, and capture cities in the style that is wrought on the two big gates. The events are about as veritable as the palaces and jewellery and murders in the neighbouring Porte St.-Martin Theatre. The Chaldean kings, who lived at least sixteen centuries before our era, may have been as imaginative as the most Christian kings of the seventeenth century, and believed that they did other men's work with their own hands, in the same way as GEORGE IV. took credit for the courage he displayed at the head of a regiment at Waterloo. A slave may have drawn the plan in fear and trembling about the consequence of disapproval; but nevertheless the fact that a king adopted it gave an exaltation to the art from that day forth, and, when the erudite conservateur paid a compliment to his audience in the neat style of a Frenchman, who can wonder if there was for the moment a conviction of the pre-eminence of the art above its sisters?

The afternoon meeting commenced with a paper by M. MARCEL DESLIGNIERES on "Pottery." It treated of the art in all times and countries, the ancient pottery of America receiving its due share of attention. The writer kept throughout in view the relation between architecture and ceramics, and it is a subject which he has made his own, having read papers upon it before the Union des Arts Décoratifs. In one statement at least we venture to differ from M. DESLIGNIERES. He asserted that terra-cotta was never used by Greeks or Romans as a means of decoration for their temples. But in the excavations at Metaponten, which were carried out by the Duc de LUNES, terra-cotta was found in the materials, and two bas-reliefs were lately discovered near Nemi. Considering how much remains to be done in excavations, it is rather premature to assert any principle in respect to ancient decorative work as being universal in its application.

The paper was followed by a *causerie* that was no less exhaustive. The Société Centrale does its best to encourage fellowship between the metropolitan and provincial members. In answer to a special invitation M. COQUET came from Lyon to discourse upon Spain. The subject was described as *A travers l'Espagne*. For over an hour M. COQUET favoured his auditory with descriptions of the geography, geology, history, and productions of Spain, as well as of the buildings, statues, and Cosas de España in general. There was not a single note employed, and yet there was no hesitation throughout. The talk was not like ordinary talk or disjointed Parliamentary oratory, but consisted of definite sentences and paragraphs which would bear to be reported verbatim. As an intellectual exhibition it was a remarkable feat. The discourse was most likely carefully prepared beforehand, but the manner of delivery was so perfect and so quiet that it was impossible to point out a part that did not seem to be unpremeditated, or as they say in Spain, "segun y conforme." There was no attempt at elocution, and from beginning to end an uniform style was preserved. Some may think there was not much in the task, but let any one who is incredulous commit to memory about fifty pages of the introduction to FORD's "Handbook to Spain," and then endeavour to deliver them trippingly on the tongue, and they will realise the difficulty. The art was so marvellously concealed that we doubt if M. COQUELIN himself could have gone through the conference with so much ease.

A visit to the abattoirs at La Villette was arranged for Wednesday morning, but work of the kind cannot have much interest for an English architect. For the afternoon meeting it was arranged that MM. G. PERROT and CHIEPIEZ were to describe their attempt to realise the appearance of the first temple of Jerusalem from the descriptions, but the length of this notice prevents us from giving an adequate account of it this week. M. LUCAS was also to give an account of the congress of learned societies. Thursday was devoted to an excursion to Rouen. On Friday the reports of various committees are to be read, and on Saturday the medals of the societies are to be distributed. In the evening will be the annual dinner.

## THE ROYAL GOLD MEDAL.

THE closing meeting of the session of the Royal Institute of British Architects on Monday evening has been one which in every way will compare favourably, to say the least, with any similar occasion in years gone by. It was characterised by interest of no common kind, and the dignity befitting an Institute representative of the profession of British architecture came to the front gracefully and spontaneously. The presence of the fair sex contributed honour to the occasion. Moreover, a genial atmosphere suggestive of pleasant business pervaded the assemblage, and was produced, no doubt, by the knowledge that the meeting had for its purpose the exchange of kindly courtesies consequent on the recognition of the valued labours of an esteemed *savant*, whose reputation in the course of years has culminated and spread so widely. In addition to this, other business had to be transacted in rewarding the studies of youthful aspirants to fame with well-earned and valuable tokens of approbation, and also to hang on the walls of the Institute a memorial portrait of the excellent past President, Mr. HORACE JONES.

First among the agreeable duties to be fulfilled was the presentation on the part of Her Majesty of the Royal Gold Medal by the Institute, through the hands of its President, Mr. EWAN CHRISTIAN, to Dr. HENRY SCHLIEMANN. The hearty pleasure with which it was apparent the meeting conferred the highest distinction at the disposal of the Institute on Dr. SCHLIEMANN, was amply repaid by the unfeigned pride and pleasure with which it was received, and words, however eloquent, could not have more gracefully expressed the appreciation with which Dr. SCHLIEMANN received the testimony of the regard he is held in by the British architects. His presence alone would have insured him the courteous reception accorded to him, seeing that men of the kind are seldom at a loss to find a pretext for absenting themselves, more especially involving, as his presence on Monday did, a voyage from Athens.

Next in order came the award and distribution of prizes, and the students who were fortunate enough to be present and personally receive their medals from the President will remember with pride that they received them in the presence of so typical an assemblage, not to mention the British Royal Gold Medallists, all of whom were present except Mr. BUTTERFIELD, who never attends any meetings, Mr. PENROSE, who has been recently engaged at Athens, and Professor DONALDSON. In years to come they may speak of the same to other students from the presidential chair. One lesson they could learn that night, said the President; they could strive to imitate Dr. SCHLIEMANN in his industry and energy in fighting against difficulties. Nor was it unlikely that they themselves might come to occupy the presidential chair of the Royal Institute. Had any one told him in his student days that he would some day be President of the Institute, he would have laughed at the idea. "Yet," said Mr. CHRISTIAN, "here I am"—a peroration which raised a good-humoured laugh. As to the prizes, the work submitted by the students had been so excellent that, as the President said, the Council had been taken by storm, and had been obliged to award one medal after another, an act of extravagance of which he highly approved, notwithstanding his deep-rooted hatred of extravagance.

Mr. CHARLES BARRY presented the portrait of Mr. HORACE JONES for the acceptance of the Institute, and coincidentally with his first remarks the electric light shone out with theatrical effect. The hall had been in comparison but indifferently lighted with oil lamps as a substitute for the electric light, which in some unexplained way had failed, and for the gas, which had been displaced to make room for electricity. In speaking of the career of Mr. HORACE JONES, an allusion was made both by Mr. BARRY and Mr. CHRISTIAN to early days, when a band of students started on their travels abroad. Of these seven only three remained—Mr. HORACE JONES, Professor HAYTER LEWIS, and Mr. CHRISTIAN—all of which survivors had come to occupy the presidentship; or, to speak more correctly in the case of Professor LEWIS, the honour would have been his had he not declined it on the score of ill-health. Mr. FRANK HOLL, R.A., has done both justice to his sitter and to himself in the production of the excellent portrait of the

"substantial city magnate," in which Mr. CHRISTIAN said he could recognise the face of the comrade with whom he had walked across the Campagna of Rome in their student days. Mr. HOLL's intention of becoming an Honorary Associate of the Institute was in harmony with the other agreeable transactions of the evening, and the appreciation of his services was marked by a most cordial vote of thanks, passed on the motion of a brother artist, Mr. GEORGE AITCHISON.

## THE SCIENCE AND PRACTICE OF VENTILATION.\*

By ROBERT BOYLE.

IT is often urged against automatic methods of ventilation that when ventilation is most required—*i.e.*, when there is no wind blowing and a perfect stillness is supposed to exist in the air—it is inoperative. Dr. PARKES meets this objection in a very conclusive manner. He says:—"In this country, and indeed in most countries, even comparative quiescence of the air is scarcely known. Air is called 'still' when it is really moving 1 or  $1\frac{1}{2}$  miles an hour. Incessant movement of the air is a law of nature. We have only to allow the air in our cities and dwellings to take share in this constant change, and ventilation will go on uninterruptedly without our care." Professor MACQUORN RANKIN, one of the very highest authorities on engineering, gives the following report as the result of careful and extended experiment:—"There is no time throughout the whole year but when there is a sufficient movement of the atmosphere at the level of the house-tops to cause the Air-pump ventilator to act." This has also been my own experience wherever the Air-pump ventilator has been applied, having always found a steady and constant up-draught and a plentiful supply of air passing through the inlets even during a dense fog or in the closest day in summer, when there was seemingly not a breath of air stirring. So satisfied is the firm of which the writer is a member that this is invariably the case, that we are always prepared to guarantee that it will be so wherever we apply our system of ventilation. The London Custom House is a striking instance of the failure of artificial and the success of automatic ventilation, that building being pronounced, since the Air-pump ventilators were applied, to be one of the best ventilated in London, whereas before it was notorious as being one of the worst.

Had my experience been different to what it has been, and I had found that automatic or natural ventilation was not to be depended upon for securing a constant change of air, at all times, and under all conditions of the weather, I would certainly have discarded it long ere this in favour of some more reliable method; but all my experience proves—and I believe it to be also the experience of those who have tried both systems—that automatic ventilation is in every way superior to any form of mechanical or artificial ventilation that is at present in existence. This opinion is based on fifteen years practical experience of almost every known system of ventilation in use at home and abroad, having specially studied the requirements of the climate of each country with the view of making myself practically acquainted with the value of the systems of ventilation in use. The past fifteen years have been devoted to the unremitting study of both the science and practice of ventilation, and how to achieve it in the simplest and most effective manner, and I have adopted the automatic, or natural mode of ventilation, as being the one which my experience went to prove was the best and most likely to answer the purpose, and at the same time, from its simplicity and economy, be capable of universal adoption. This selection is endorsed by Dr. A. SMITH in one of his papers on ventilation, in which he says:—"As it is evident that the greatest ingenuity and the most extravagant outlay are not of themselves sufficient to insure perfect and constant ventilation, we must look to natural means for effecting this purpose. We require some apparatus that is continuous in its action and self-acting in every part, so as not to need any attention after it has been once fixed. An examination of many forms of ventilators

has led me to the conclusion that the only apparatus that comes up to this standard of perfection are those manufactured by Messrs. BOYLE & SON, and termed by them 'Self-acting Air-pump Ventilators.' The thousands of public and private buildings which have been successfully ventilated by my firm in every quarter of the world, with the automatic system, after the failure in a large number of instances of almost every imaginable kind of mechanical and other forms of artificial ventilation, has fully demonstrated the correctness of the principle adopted and adhered to.

There are several forms of ventilators introduced which rely for their action upon the aid of water, but they are not only very liable to disarrangement, but those where water is employed to create a suction, and through which the air has to pass, instead of being beneficial are positively injurious to health, owing to the excessive amount of moisture which is taken up by the air and forced into the room. Standing close to one of these appliances, the moisture absorbed by the incoming air can be distinctly felt falling upon the face in the form of a fine spray, and a handkerchief placed over the mouth of the ventilator will be thoroughly saturated in a very short time. The effect of this in a hot room may be imagined, and in a cold room the result will certainly be anything but agreeable, to say nothing of the damage done to the contents of the room by the action of the damp air. When heating arrangements are used in conjunction with these water-power ventilators the result is a hot steamy atmosphere, causing that disagreeable "stewy" feeling which is always experienced whenever there is an excessive amount of moisture in a heated atmosphere. The climate of this country is of itself, alas! much too damp as it is for perfect comfort and health, without our voluntarily seeking to render the air we breathe and are surrounded with in our homes and halls more so by employing artificial means to effect this. Every sensible person will admit that any system of ventilation which tends to make the atmosphere of a building damp cannot be too strongly condemned, as pernicious in principle, injurious to health, and destructive to personal comfort. This is not, however, to be taken as applying to the process which has long been in use of washing the air by causing it to pass through a series of jets of water, which is a very different thing, there being not anything like the same danger of absorption of moisture by the air as when it is passed through a fine spray. Even allowing that these water ventilators had not the fault described, there are the great barriers to their general adoption, the expense of applying them and keeping them in action, and also the attention that is necessary to regulate them, which attention, as a matter of course, as all experience has proved, is never given, the result being that the ventilation is irregular and very often nil, and in time the apparatus gets out of order and is finally neglected altogether. "The difficulty of overseeing a complex apparatus is another source of imperfect ventilation in large houses" (BUCK). "The disadvantages are the great cost, the chances of the engine breaking down, and some difficulties in distribution" (PARKES). "Revolving fans, driven by water, and all other ventilators having movable parts, are not to be recommended, owing to their liability to get out of order and break down" (Professor CORFIELD). Drs. THOMPSON and STEELE (Guy's Hospital), in their "Dictionary of Domestic Medicine and Surgery," say:—"Occasionally pumps and fanners worked by steam machinery are employed for the purpose of admission and extraction of the air; but, although this method of ventilation has many advocates abroad, its trials in this country have not been particularly successful." Referring to the Air-pump ventilator, these gentlemen say:—"There can be small doubt of the efficiency of this contrivance." Dr. REID, than whom no higher authority on the subject can be quoted, in giving his opinion on the relative values of natural *versus* artificial ventilation, says:—"For all ordinary purposes the natural method of ventilation will be found most eligible. . . . On the whole, then, it may be concluded that, for a large proportion of ventilating purposes, the best mode of proceeding is to take advantage of the natural movements developed in the greater number of cases in the vitiated air by heat for securing its discharge, assisting its exit by the force of such wind as may exist by the form given to the external aperture." "In

\* All rights reserved.

temperate climates, in most cases, natural ventilation is the best" (PARKES). Carefully-conducted experiments have proved that with a proper arrangement of ordinary inlet-tubes and suitable extractors on the roof a sufficiency of air for all the requirements of ventilation passes into a room without the aid of any mechanical or artificial contrivances to force it in—the use of which, instead of being an advantage, is exactly the reverse, as will be shown further on. GALTON observes:—"The simplest way of obtaining a change of air in a room is to take advantage of the movement in the air produced by a change of temperature or the action of the winds. Wherever there is an outlet and an inlet in a room this system will operate."

It will be found by any one who chooses to make the experiment that the amount of work actually done by artificial ventilators is more imaginary than real, as a considerable portion of the air that passes in through them is not due to their action at all, but to the natural pressure of the external atmosphere. This is a fact very easy of demonstration, as we have only to turn off the water, steam, or whatever power may be used, and allow the pressure of the outer air to assert itself—which, as a rule, it will be found to do in a manner that will probably be a surprise to many who have put their faith in the value of artificial propulsion. As the result of General MORIN's experiments, instituted to test the comparative values of natural and artificial methods of ventilation, and which experiments extended over nearly a lifetime, he states:—"Much of the movement ascribed to the fan is really owing to natural ventilation;" and, referring to the power of the steam jet as a ventilating medium, he says:—"This method of propelling air is not advantageous." Where water is employed as the propelling power, the force, of course, would be infinitely weaker than with the above-mentioned appliances, and the amount of air really put in motion by its action very small indeed. In making comparative tests care should be taken that the inlet openings of the artificial ventilators communicate with the outer air, so as to be subject to the pressure of the external atmosphere, otherwise the tests will be inconclusive and valueless.

Vertical tubes or brackets are the best forms of admitting air, which is introduced into the room in ascending columns, and assists to force out the vitiated air whilst diffusing itself throughout the room. In making provision for the admission of air it is absolutely essential, to secure proper and equal ventilation, that the inlets should be of small size and well distributed round the walls at short distances from each other. By thus reducing the size of the inlets and increasing their number, the more perfect will the ventilation be, whilst the chance of draughts will be reduced to a minimum. It is a fatal mistake to admit air into a large building, such as a church or hall, from one or two points only, and at a high velocity. Where this is done, those sitting in the vicinity of the inlets have a great deal more air than they find either comfortable or desirable, whilst those in the other parts of the building, and out of the direct range of the incoming currents of air, are stifled for want of it. This is the common experience wherever this method of admitting air is adopted, and it is also the cause of the seemingly inconsistent complaints which are so often made respecting the ventilation of a building, where one person complains of insufferable draughts and another of the stagnant and stifling atmosphere. Air should never be forced into a building at a high velocity, but should pass in slowly, so as to permit of its proper diffusion, and also to avoid draughts. Where it is otherwise admitted the object in view is defeated, as it passes through the room in a compact body and out at the exits, without effecting anything more than the feeling of a disagreeable draught by those unfortunate enough to be in the line of it.

It may, therefore, be looked upon as not only a waste of money, but an unwise action as well, to employ any form of mechanical or other artificial arrangement, such as fans or water-power ventilators, to provide a supply of air, when experience has proved that wherever they have been employed failure has invariably resulted.

MR. ERNEST TURNER, F.R.I.B.A., in one of his works entitled "Hints to Householders," &c., describing the action of these water-power ventilators, says:—"A curious illustration of this has been furnished at the Reform Club, where a

ventilator worked by water had been newly put up in the smoking-room. But instead of driving out the smoke, the concentrated current from the new machine simply shouldered it out of the way, and, cutting a little tunnel straight to the opposite outlet, took possession of that outlet for its own exclusive benefit, the net result being that the smoke, which before escaped but imperfectly, now escaped not at all. And the too single-minded apparatus had to be incessantly removed." All ventilating appliances which artificially force air into a building act in a precisely similar manner. DE CHAUMONT says:—"If the air enters at a high velocity it will make its way to the outlets without mixing." Whilst GALTON observes that "the velocity of the air, as it flows into a room, should not exceed one or at most two feet per second: firstly, in order to prevent a sensible draught being felt; and secondly, because a low velocity is favourable to the uniform diffusion of the incoming air through the room. The inflowing air should be directed towards the ceiling, and should be as much subdivided as possible by means of numerous orifices."

It may therefore be taken as correct that all that is requisite to secure the admission of a proper supply of air into a building is the use of a sufficient number of simple inlet-tubes judiciously distributed round the room. The cost of this plan is but a mere trifle as compared with that of the elaborate and expensive contrivances for forcing in air, and no after expense is incurred to keep it in action; nor can it get out of order like the other, nor fall into disuse through neglect and want of attention.

Where, however, artificial means are employed to assist in the ventilation of a building, they should always be used for the purposes of *extraction* only, and never for the admission of air. If the air is extracted out of a building, which can generally be done without discomfort to any one, an equivalent amount to that extracted will infallibly find its way in, and all we have got to do is to make provision as already described for its proper diffusion throughout the room. The highest authorities are agreed as to the advantage of this arrangement. GALTON says:—"Experience has shown that a system of propulsion does not act satisfactorily in this climate unless it is combined with a system for the extraction of the vitiated air. Under ordinary circumstances, where extraction is resorted to, an adequate quantity of fresh air can be drawn in by the operation of the extraction-shaft, without the additional expense and trouble of propulsion. . . . The best form of inlet to adopt is that which is simplest."

Heat, when employed as a ventilating medium, is useful under certain conditions, and if used in conjunction with other arrangements, but by itself it is not so efficacious as is generally supposed. It is the popular idea that a column of heated air in a shaft or flue always ascends, but this in reality is very far from being the case, more especially in the winter time, as the cold external air, through being so much heavier, forces itself down the shaft and presses the hot air along with it. If this were not found to be the case, where would be the necessity for providing the delicately-adjusted, self-acting valves which are usually fixed in the shafts of so-called ventilating sunlights, for the purpose of preventing the down-draught from blowing out or causing the lights to flicker? Very many instances could be here mentioned as illustrating the inefficiency of this mode of attempting to secure ventilation, but one or two cases will suffice. At the Rev. Dr. WALLACE's church, Glasgow, several rings of gas jets were fixed at the lower end of a shaft carried through the roof, and covered at the top with a cap to exclude rain. This arrangement was intended to ventilate the church by creating an up-draught and so drawing off the vitiated air; but when put in action and tested, it was found that instead of the hot air going up, the down-draught was so strong that a number of jets were being continually blown out, and when a lighted taper was introduced into the shaft it was likewise blown out; flocks of cotton-wool were also driven right down into the church, the down-draught being so strong. The Western Infirmary, Glasgow, is ventilated by means of hot-water coils placed in shafts communicating with louvred turrets on the roof, in which are placed hot-water cylinders. On testing this system directly above the cylinders a strong down-draught was experienced, flocks of cotton-wool being driven with considerable force down the shaft. At no time during

the experiments was there any abatement in the down-draught, or the slightest tendency to an up-draught. Now, in neither of these cases need this down-draught have existed at all, as by placing a reliable extracting ventilator, such as the Air-pump ventilator, on the tops of the shafts, the pressure of the cold, external air would have been removed and a continuous up-draught insured. A striking instance of this occurred at the Guildhall, London. The extraction-shafts there were provided with a series of rings of powerful gas jets for the purpose of creating an upward current; but instead of doing so the down-draught was found to be so great that the shafts had all to be incessantly stopped up.

On the application, however, of Air-pump ventilators to the tops of these shafts the down-draught at once ceased, and a powerful and continuous up-draught was established and maintained even on the muggiest and closest days. What may seem a remarkable thing to those who believe in ventilation by heat alone is, that when experiments were being conducted in the presence of a distinguished body of scientists, the gas jets when lighted were found not to add to the up-draught in the slightest degree, the anemometers registering the same quantity of air extracted by the Air-pump ventilators when the burners were not lighted as when they were.

It would be interesting to know how the gentlemen who were responsible for what is known as the "Kew Farce" could reconcile their theory of a plain open pipe being superior to all forms of roof ventilators, with the foregoing facts, when, even with the assistance of heat, their pet "open pipe" produced nothing but a down-draught, which, I think, even they will allow is not a very comfortable or desirable mode of ventilation. Dr. PARKES—than whom we have no higher authority on the subject—in stating the cause of the general failure of ventilating pipes open at the top, and unprotected by a properly-constructed ventilator to create an up-draught and prevent a blow-down, says:—"The wind may impede ventilation by obstructing the exit of the air from any particular opening, or by blowing down a chimney or tube. This is, in fact, the reason of the failure of so many systems of ventilation." GALTON also says, referring to open pipes:—"In consequence of the numerous causes of disturbance enumerated above, this method of extraction, when applied to a house, could not be relied on to act on all occasions with certainty as an extraction shaft." It is a universal experience that wherever an open pipe, or one with merely a cap on the top to prevent rain getting in, is used for the purpose of ventilation, a down-draught is the invariable result; and how, in the face of this, any one can be found, in this enlightened age, to assert that a simple open pipe is the best form of ventilation almost passes comprehension. If open pipes really answered the purpose, how is it that, wherever they are used, they are found as a rule to be stopped up? And if extraction ventilators were not found to be necessary, how is it that scientific and practical men have busied themselves for ages devising them? One might go on *ad infinitum* quoting instances of the failure of heat and open pipes when used as ventilating mediums, but I will merely refer to the official report submitted by Mr. ADAM LEE, in 1813, to a Committee of the House of Lords on the system of ventilation applied to the House by Sir HUMPHRY DAVY, in which he (Sir HUMPHRY) employed and relied upon the agency of heat to secure an exhaust. In this report the following significant passages occur:—"I have found on a very crowded night of business that it was impossible by means of the present ventilators to draw off the heated air. . . . I consider the fire to the ventilators as unnecessary. . . . I have at various times taken an opportunity of going on the top of the House, and have put my head over the ventilation pipe when the fire was at full heat, and have not perceived the hot air coming from the House." Now what does this prove but that there must have been a strong down-draught in the shaft, as in the other cases cited? otherwise Mr. LEE would have been certain to have felt at least the hot air arising from the furnace.

Heat was employed to extract the foul air from the House of Parliament, Melbourne, Australia, but it proved a failure, and had to be supplanted by the Air-pump ventilators, with, it may be stated, the most satisfactory results. Gas-jets may occasionally be used with advantage in external

shafts and air-flues, fitted on the top with exhaust ventilators, for the purpose of rarefying the column of air in cold weather, which otherwise might be liable to condense through the action of the external atmosphere on the shafts. An outer casing with the space between packed with sawdust will answer equally as well, and is in the end perhaps the cheapest and least troublesome plan.

### VICTOR HUGO AS AN ARTIST.

THE following is a translation of the discourse which was delivered in the Panthéon at the funeral of Victor Hugo by M. Guillaume, the sculptor, who had been elected to represent the Society of French Artists on the occasion:—

The great poet for whom we appear in mourning was an incomparable artist. The artists of France could not therefore fail to bear a part in the solemn homage which is to day rendered to him. They feel proud that they can claim kinship with Victor Hugo, for if he has expressed the thoughts and aspirations of his own age, if he has recalled the past and gazed with prophetic vision on the future, he has likewise given to his work a character through which it becomes related to all the arts. In Victor Hugo art was closely united with poetry.

There are two modes of inspiration, and the difference between them is very slight. Poetry, being fertile in expressive images, can create representations which are full of life. But it is not always necessary to have the materials which will give them forms that will be apparent to the senses. In poetry it is spirit which appeals to spirit. Nevertheless, the poet is at times able to give a quality to his creations by which they correspond with the figures that are produced by painters and sculptors. Then it is they appear to have a sort of reality for us. We believe that we must have seen them somewhere, and the memory of them remains with us as if they were beings whom we had once known.

Among all the poets Victor Hugo had the strongest faculty for the creation of what may be called plastic illusions. How vast a multitude of examples could be cited of his necromancy? In describing the doomed cities in his "Orientales," Victor Hugo would appear to have been some great architect, for archæology can find nothing to correct in his pictures, and indeed he anticipated many of the results of modern exploration. In respect of all things he was possessed of the poet's divination. In his early days he restored Mediæval times for us in his "Odes et Ballades," and somewhat later in his "Notre Dame de Paris." A fervid admirer of the national architecture of France, he was able to make other people also love it, and organise a public department for its conservation.

Where is the sculptor who has carved the figures of gods and heroes, of men and nations, with more energy and precision than Victor Hugo? He writes a few words, and they are enough to render all the phenomena of form visible to our eyes. This could not be done without many strokes of the chisel. Three verses suffice to represent the career of Napoleon. Exact observation, historic truth, a sentiment of art are condensed in them. The art of the sculptor is surpassed. How many other images have issued from his mind—some which are isolated and massive as blocks of granite, others which seem to be cast in bronze, and almost overcome us with their power!

He was no less a painter, in the variety and richness of his forms and in his sense of colour. Every one who has read his "Légende des Siècles" will remember the first poem, "Le Satyre," which fascinates while it dazzles with its colour and light. And it should be remembered that his ardent study of nature was not of the outside only, but was no less profound than that of the man of science. In this union of poetry and science we have an example by which future ages, as well as our own, may well be guided.

But what shall I say of the harmony of his poems and of the variety of movement in them? With Victor Hugo rhythm always follows sentiment. It corresponds with the thought, whether it be serious or gay, whether lively or depressed, whether sustained as in a symphony from nature, or abrupt as in a dialogue or a lament, or solemn as in a philosophic meditation. What music is in his poetry! Even if we take no account of the sense of the words, they lull or exalt the mind by the melody of the sounds and of the versification.

Yes, Victor Hugo was a great artist, a perfect artist, the grandest of all in our age. In his works he has recognised that unity of art which was an ancient faith. He was in unison with all forms of human action—they vibrated in him and he became their interpreter. The crayon was always in his hand, and his designs are inimitable. But his greatest glory, like that of the sublime poets, will be in the inspiration drawn from his books. His works, like those of Homer and Dante, are a school. Admiration is productive, and we can all draw great thoughts from them. It was from a verse of Homer that Phidias derived his idea of the Olympian Jove. Sculptors can obtain suggestions from the lines of Victor Hugo for noble figures, worthy of being embodied in the most precious materials. I seem to see upon his tomb the images of the virtues which gave inspiration to his genius, namely, Justice and Pity.

No funeral has been more magnificent, more imposing, more triumphal. We have had in our midst a genius that was without equal. Honour to him! Honour to the poet who has given a character of universality to his works! Glory to the master who was a sovereign in art and form, who has in his poetry given an intellectual representation of all the arts! The French artists on this memorable day, which is consecrated to his apotheosis, desire to place a golden laurel on his bier.

### CHURCH RESTORATION.

AT the annual meeting of the Durham and Northumberland Archæological Society in the city of Durham, the Rev. W. Greenwell, F.S.A., president, made an address, in the course of which he made some remarks on various buildings visited by the society during the past year, in which he expressed his views in regard to restoration and architectural treatment. Speaking of Corbridge Church, he said that structure had been restored, and restored on the whole remarkably well. It was not restored by an architect. He did not mean to infer that an architect could not restore a church, but he was afraid that very often they more than restored it—they did a great deal in the way of destruction. He could not tell why it was, but it seemed to him that the architects of the present day seemed to have a great desire to interfere with the works of their predecessors. They had evidences of this not only in their own county, but also in other parts of the country. Those who had restored the church at Corbridge had endeavoured as far as possible to preserve the ancient features of the building. The church was one of considerable interest, especially the tower, which was probably built before the time of the Norman Conquest. It was one of a class of towers of which we had a certain number in the county of Northumberland, and in the valley of the Tyne especially, and it was difficult indeed to say to what particular date they belonged. There was no question that they belonged to some time about the Conquest, and he was inclined to think they were built before that event took place. The architectural features implied a time somewhere between the year 1000 and 1066, a little before or a little later, and, from the reasons he had given, he thought the date before was to be preferred to the date of a little after. That class of tower was quite different from what they saw at Monkwearmouth, about which latter there was no question whatever that it was considerably antecedent to the time of the Conquest. They were of a different character from that, though they possessed somewhat similar characteristics. The towers at Lincoln presented many of the same features, and they knew that these towers were built certainly after the Conquest, but very soon after. At Haughton-le-Skerne they saw the church, which fortunately had not undergone restoration. It had been threatened with it at various times; in fact it might be said to have been threatened with destruction, but there was a difficulty in the way, and fortunately at present it was not likely to be destroyed. He did not think that as long as the present rector lived that anything would be done to it. The two days' meeting they had last year was one of the pleasantest they had for some years. But the place in which they had the most interest on that visit was Norham Castle, a place of great importance at all times. Situated at one of the most important points of the river Tweed, it was the only place which could be defended when the two countries were under separate monarchs. Therefore, it was one of the largest castles upon the borders, and a great deal of it had been left, especially the keep. The earliest part of the keep was built by Bishop Flambard, and later on it was altered by Bishop Pudsey. It was a question as to which part of the work had been done by one and which by the other. When they were there they were able to satisfy themselves on this point, but in absence from the place he could not explain it to them. The keep remained in its entirety, but the sur-

rounding buildings had been more or less destroyed, because wherever they had a place like that in the neighbourhood of a large village or small town, it was sure to be used as a quarry to obtain stones for building purposes. Norham Church was a very fine one, but had to a certain extent been detrimented by restorations which took place before so much was known of Mediæval architecture as now, and therefore some excuse could be made for what had been done. But what had been done lately had been well done, and he did not think anyone could say that the late restorations had destroyed anything. There were one or two matters to which he desired to refer, and the first was with regard to a place in the cathedral which had been locked up ever since the destruction of the chapter-house, and that was the prison of the monks for minor offences. The great prison of the monks was situated in the quadrangle, which is now called the college, and occupied the site of the house in which Canon Evans now lives. That was the great prison, but there was the minor prison where the monks were confined for slight offences, and it was a very wretched place, being a good deal worse than the black hole of prisons nowadays. Up to the time of the destruction of the chapter-house, the only entrance into that prison was through the chapter-house. When the chapter-house was rebuilt to a certain extent the prison was blocked up, and in doing so they destroyed the original doorway, which would have been of great interest in connection with the age of the prison. He was of opinion that it belonged to the earliest part of the cathedral, and was erected before the time of Bishop Rufus, who was said to have built the chapter-house. There was also another room, upon the walls of which there were some fresco paintings, the subjects of which could still be partly made out, and that also seemed to be contemporary with the earliest part of the cathedral. There was also a third and smaller chamber close to the others he had mentioned, and he was inclined to believe that they were erected at the time that Bishop Carleph was away in exile in Normandy. The President proceeded to refer to the destruction of ancient churches. Wherever they went they found that church after church was being destroyed, and if they continued to go on as they were doing there would not be a single old church left in England. Many of the churches were altered in the most ignorant fashion.

### SOCIETY OF ENGINEERS.

AT a meeting of the Society of Engineers, held on Monday evening, the 1st inst., at the Town Hall, Caxton Street, Westminster, Mr. Charles Gandon, president, in the chair, a paper was read by Mr. Henry Faija, on "Portland Cement."

The author said that, though much had been written on the subject, little was generally known, and contradictory conditions were often specified. He considered that the weight test was of little or no value to the purchaser, though it had a use for the manufacturer. Specifications should be as simple as possible, and the author advised the adoption of the ordinary quality of cement, obtaining the different strengths required by varying the proportion of sand or aggregate, in preference to specifying unusual qualities. The only points which need to be tested are fineness, tensile strength, soundness. After defining the degree of fineness which he considered most desirable, having regard on the one hand to strength, and on the other to economy, the author treated in detail the subject of testing. Experience showed that cements which set rapidly attain their full strength in a few months and have then a tendency to fall off, while a slow-setting cement continues to increase in strength for an indefinite period. The best practice is to test the briquettes at three days after moulding and again at seven days. At the former period they should not break under 175 lbs. strain, or at the latter under 350 lbs.

The author then showed and described a machine that he devised some years ago, and had successfully used since, for gauging cement; also a testing machine, specially arranged to give the most advantageous rate of speed in applying the pressure, which he found to be 100 lbs. per fifteen seconds. It was by no means safe to assume that, because a cement bore the required tensile tests, it was necessarily sound, and some cements were long in showing unsoundness, or "blowing." Means were therefore described by which this quality could be ascertained at as early a period as possible, by being artificially developed in an apparatus designed for that purpose.

A form of specification, founded on experience in these several respects, was then given, and the paper concluded with some reference to the chemical tests for purity, introduced in German practice by Dr. Fresenius, and with the author's testimony to the freedom of English cements from the adulteration against which these tests were intended to guard.

The Glasgow Town Council will give the sum of 2,500*l.* to the guarantee fund of the proposed international exhibition at Edinburgh in 1886.

## NOTES AND COMMENTS.

THE house belonging to the late WILLIAM BURGESS, in Melbury Road, Kensington, may be said to be unique. For many years he had been planning the erection of such a building, and designed furniture and plate long before the site was selected. He wished to demonstrate practically what his art could do in adapting Mediæval forms to modern needs. BURGESS was indifferent to the opinion of passers-by, and it is in the interior of the house that we see the realisation of his dream. Mr. PULLAN proposes to bring out a book in which the building and its contents will be amply illustrated. It will be of a large size, and contain forty photographs, many of them by Mr. BEDFORD, whose skill was appreciated by Mr. BURGESS. The plates will be accompanied by descriptions, and the binding of the volume, a design by BURGESS, will be utilised. The book will necessarily be costly, but there are enough admirers of the artist, besides public libraries and museums, to insure its success.

A COMMISSION has been constituted in connection with the French Société Centrales des Architectes, with the object of securing fair play in architectural competitions. As the results affect the artistic reputation of the country, the conditions of every competition should, it is affirmed, be of a nature to inspire confidence, and attract the largest number of competitors. The commission is composed of *ex-officio* members—MM. QUESTEL, HERMANT, LABROUSTE, and PAUL WALLON representing the Société Centrale; two associated members, viz., MM. ALPHAND and POULIN; and several elected members, including members of the Institute, architects to the Government, to the City of Paris, &c. All the members are in the foremost rank of the profession. The commission is prepared to give advice to administrations, societies, and municipalities on the preparation of conditions, selection of juries, awards, and prizes, and as the members are disinterested in their efforts for the public good, they appeal to the country for support.

AN account, entitled "Five Years' Municipal Work in Nottingham," has been published in a pamphlet form by Mr. ARTHUR BROWN, of the Institute of Civil Engineers, and borough surveyor of Nottingham. The intention of the writer has been to describe some of the more important municipal undertakings, and to summarise in a general way the work directly connected with his office, rather than to present a complete history of all the undertakings of the Corporation during the term of years. The matters treated of are placed under six heads, viz.:—1. Particulars of population, with special reference to the rate of increase; 2. Number of new buildings erected; 3. Roads and streets, including private street improvement works; 4. Storm-water culvert and general sewerage works; 5. Public street improvements; 6. A description of the pail-closet system]

THE information given under head No. 2 is remarkable. It states that it is estimated that during the five years ending March 31, 1885, there were built in Nottingham about 13,500 houses. The greatest number of houses that were built in one year was in 1883, when 3,302 houses were erected. In that year returns were obtained from twenty of the largest towns, and it was found by comparison that, having due consideration to its population, the building operations in this town were quite unprecedented. The number built in the borough in that year nearly equalled the number erected in Liverpool, Birmingham, Glasgow, and Leeds collectively; these four towns represented a population of 1,839,000, whereas Nottingham then had a population of 205,000 only. Taken at the low average cost of 150*l.* per house, the result would be upwards of 2,000,000*l.* as the amount spent on house-building operations in five years.

A COMMITTEE has been appointed, with M. VICTOR SCHËLCHER as president, for the purpose of raising subscriptions for the erection of a memorial to VICTOR HUGO in one of the public places of Paris. Among the vice-presidents is M. BONNAT, the portrait painter. The

space in the Louvre which has been appropriated to the Gambetta memorial has been enclosed by a very high hoarding, which is adorned by advertisements, some being painted in oil in order to endure until the timber is removed, while others are changed from day to day. The *bizarre* appearance of so prominent a piece of construction in the centre of the grounds diminishes the effect of the buildings of the Louvre, and it is surprising that the enclosure was not withheld from the advertising contractors and glaring posters. The committee have applied to the Government for the delivery from the stores at Cherbourg and Toulon of a number of cannon that will be sufficient for the casting of the figures. Forty-two pieces have been granted, which will weigh about 17 tons.

AUTOBIOGRAPHIES, as a rule, are seldom interesting reading. Mr. RUSKIN, in introducing the first chapter of his autobiography to the public, gives a useful hint to writers of autobiographies in his preface to the work, where he says:—"I have written these outlines of scenes and thought in my past life ('Præterita') frankly, garrulously, and at ease, speaking of what it gives me joy to remember, at any length I like—sometimes very carefully of what I think it may be useful for others to know, and passing in total silence things which I have no pleasure in reviewing, and which the reader would find no help in the account of."

THE report of the Consul on public works at Suez is short and suggestive. Under the head of public works he says:—"In this respect nothing has been done; not even has an attempt been made to repair the walls of the basin, or to prevent them from falling in. The docks are now used almost exclusively by Her Majesty's ships and transports, and the steamers of the Khedivial Steam Navigation Company. The postal steamers no longer go there, the Peninsular and Oriental Company having at last realised the fact that there was more risk than profit in bringing their vessels into the docks at Port Ibrahim.

THE final award in the competition for the proposed New Exchange, Amsterdam, took place last week. The first prize of 10,000 gulden was awarded to the design bearing the motto "V." No. 175, its author being M. CORDONNIER, of Lille. The second prize of 6,000 gulden to the author of "In hoc signo floresco," No. 150, M. GROLL, of London and Vienna. The third prize of 5,000 gulden to "La bourse ou la vie," No. 20, M. VOLKMAAR, of Berlin. The fourth prize of 4,000 gulden to "Mercatura," No. 73, Messrs. SANDERS & BERLAGE, of Amsterdam. The fifth prize of 3,000 gulden to "Ammerack," No. 91, the name of the author not having transpired.

A CUP and bowl of Samian ware, among other fictile fragments of Roman-Winchester, have lately been dug out on the site of the Star Inn, Winchester, where a fine structure, designed by Mr. T. STOPHER, of Winchester, is to be erected for Mr. G. POINTER. The bowl is described as almost as capacious as a modern salad bowl, and, although perhaps nearly eighteen centuries have passed away since it was made, its lustrous colour and vigorous ornamentation remain as fresh as ever. Rising from a small circular base, the bowl swells upwards from a decorated double circle into a series of twelve subjects, arranged in alternate circles and double panels, the figures in the latter being divided by a dotted line. In each circle is a vigorous and artistic figure of a gladiator or soldier, armed with sword and shield, and either attacking some one or defending himself. The panels are occupied by standing figures of HERCULES, with his club, and APOLLO, with a suppliant figure at his feet, whilst over his head are a bird and a cup, perhaps, and the latter is on the Herculean panel. There are various details of eight-leaved flowers, an ornament like an acanthus leaf somewhat, and with tendrils to it, and the series of subjects is surmounted with a circle of dots and a rich cornice, or edge, of the egg and tongue pattern, and about 2 inches over this is a fine moulded edge or lip, the composition being such as would command attention anywhere by its beauty.

ST. PAUL'S CATHEDRAL, LONDON: DESIGN FOR TREATMENT OF CUPOLA.

The Cobden Coffee House Extension. William Doubleday, Architect.

## ILLUSTRATIONS.

THE ARTS: THE ENGRAVER.

THIS illustration is the fourth of the series by M. EHLMANN.

## DECORATION OF ST. PAUL'S CATHEDRAL.

THE cartoons now in the cupola at St. Paul's are to be removed, pursuant to a resolution of the committee, in a few days. Neither of these versions of STEVENS' design has been approved of by them; and they will shortly decide whether any other treatment (architectural or otherwise) be more promising, whether the existing monochromes by THORNHILL be painted over with fancy colours, or whether the question be again postponed *sine die*.

Before leaving the subject it is interesting to note how, among the various opinions expressed, those adverse to my version by several distinguished Gothic architects have been as remarkable for their unanimity in objection—in a Classic subject—as for the diversity of their individual prescriptions.

Further, I would wish to place on record the manner in which I would interpret STEVENS' sketch with the experience gained by seeing the full-sized experiment *in situ*; and I submit the accompanying rough sketch. Both the version by Mr. E. J. POYNTER, R.A., and that by myself were based on STEVENS' grand design, containing two cycles of storiatio—an upper row of circles about 10 feet, and a lower row about 20 feet in diameter. After much consideration, it appears to me that *one* tier of storiated circles would be better; and hence the upper row is omitted in the sketch, and is replaced by small panels with angels of the same size and value as those in the articulating-ribs, with some necessary readjustments of sizes in the ribs, the sitting figures, and the belt of the adorning throning round the eye of the cupola.

I have suggested that the *Resurrection* would be better for the storiatio, as furnishing simpler and more "readable" subjects for the painter. I explained this fully in my paper published in the Institute Transactions at the beginning of the year, to which I would beg to refer; and the rest of the sketch may be left to explain itself.

HUGH STANNUS.

## THE COBDEN HOTEL, BIRMINGHAM.

THIS building was opened on the 29th ult. by the Mayor. It is the extension of the Birmingham Coffee-house Company's premises in Corporation Street, making the Cherry Street elevation equal to the front in Corporation Street, thus greatly enhancing the effect of this fine building. The entrance to the new Cobden Hotel is in Cherry Street. A lofty doorway gives entrance to a hall, paved and decorated with Minton tiles, and leading to staircase and passenger lift, and commercial-room, office, &c. Proceeding first by wide and easy stairs to the basement, there is a spacious vestibule connecting the old and new portions of the building, the coffee-room being on the left and the new smoke-room on the right. This is a splendid room, nearly 50 feet long by 20 feet wide. The walls are lined throughout with specially designed tiles, executed by MINTON, HOLLINS & Co. The columns are of polished granite, with richly-carved capitals of Caen stone, and the pilasters and arches are lined with marble of varied hue. The handsome mahogany buffet is relieved with majolica panels of glowing colour. A serving-room is behind the bar, and a lavatory, &c., are entered from the further end of the smoke-room. The lighting and ventilation have been specially provided for. No better lighted basement can be met with in the town. On the ground floor is the commercial room, 33 feet long, with cloak-room, lavatory, &c., adjoining. A hydraulic passenger-lift, manufactured and fixed by CLARK, BUNNETT & Co., of Rathbone Place, London, with porter in constant attendance, will traverse the total height of about 80 feet, and give visitors free access to the 120 rooms on the upper floors. Ascending to the first floor, one passes a well fitted service-room, and enters the grand coffee-room, 36 feet by 20 feet extreme size—a lofty and well-lighted apartment, with two handsome

marble chimney-pieces. The buffet in this room is adorned by a marble bust of RICHARD COBDEN, and the commercial-room by a bust of JOHN BRIGHT. The effect of the walls, which are lined with beautiful patterns of Lincrusta-Walton, is soft and pleasing. There is a large billiard-room on the second floor, with a good table. The lighting of all these rooms is by the "Bower" patent light, which gives a bright, steady flame, and, by carrying off the products of combustion from each burner by a special flue, keeps the air pure. The ventilation is by exhaust and inlet shafts, of large size, traversing the height of the building from roof to basement. The top floor of the hotel is devoted to kitchen, scullery, stores, larder, &c., laundry and steam drying-room, and servants' department generally. The bulk of the bedrooms extend on two floors over the long new range of shops in Corporation Street. They are supplied with lavatory, bathroom, and other accommodation, and an extra staircase, for use in case of fire, gives exit to the passage adjoining the North-Western Arcade. There are electric bells to all bedrooms. Externally, the building, which is Gothic, with detail somewhat French in character, continues and completes the façade of the Cobden Coffee-house. The chief features of the front in Cherry Street are a lofty oriel, three storeys high; on either side are niches, with sculptured figures representing *Prudence* and *Temperance*. Above the doorway is a bold gable. The front is of stone, with granite shafts from Aberdeen. All the principal furniture throughout the building has been designed by the architect, Mr. WILLIAM DOUBLEDAY, of Colmore Row, Birmingham. The furniture is by MARRIS & NORTON and CHAMBERLAIN, KING & JONES. The builder is Mr. JAMES MOFFAT, of Camp Hill. When completed, the whole building, with its furniture, will have cost upwards of 20,000*l*. This addition to the work of the Coffee-house Company will supply a long-felt want for a first-class temperance hotel.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE twelfth and last ordinary meeting of the session of the Royal Institute was held on Monday evening, Mr. Ewan Christian, president, in the chair.

The decease of M. Ballu, honorary corresponding member of the Institute, was announced.

Various donations were announced, and a vote of thanks passed to the donors.

Professor KERR submitted a proposal for conducting the higher operations of the Institute by means of four standing committees, to take charge respectively of four departments:—1st, art, or the province of architectural taste; 2nd, science, or the philosophy of building; 3rd, literature; and 4th, business, meaning the miscellaneous field of architectural practice; and asked that the Council would appoint a special committee to consider the question during the recess.

The PRESIDENT said that would be done.

## The Royal Gold Medal.

The PRESIDENT: Dr. Schliemann.—The medal which I am to have the honour of presenting to you this evening is the highest distinction in the power of the Royal Institute of British Architects to bestow. It is given by our patron, the Queen, but Her Majesty entrusts to us the task, sometimes a very difficult one, of deciding, subject to the Queen's final approval, on the man most worthy to receive it. I say that it is sometimes a difficult task, not from paucity of men, but rather the contrary, because this Institute, having always taken, as I think wisely, a catholic view of its responsibility, has included within its scope of vision not only architects, archæologists, and men of science at home, of whom there is no lack, but has also looked widely abroad, and invited to share with their brethren here of like pursuits with themselves the noblest and best amongst the learned men on the Continent of Europe. In the roll of gold medallists will be found the honoured names of men of Italy, of France, and of Germany—great architects, learned writers, and archæologists; and this Institute is proud to associate with that of the great Assyrian explorer, Austen Henry Layard, the now world-renowned name of Henry Schliemann. In you, sir, this Institute recognises not only the indomitable explorer, but the earnest student of the arts of past ages, one whose youthful imagination having been fired by the grand story of the great poet of antiquity has shown so powerfully that noble enthusiasm which "scorns delight and lives laborious days," that dogged pertinacity so delightful to all true Englishmen, which, having once fixed the mind on the performance of an arduous task, never wearies until it has been finally accom-

plished. Few things that I have read of late years have interested me more keenly than the simple tale of early struggles in the pursuit of knowledge under difficulties which you, sir, have given so freely to the world: a history of obstacles met only to be vanquished, of determination to learn, under all circumstances, however disadvantageous, everything that could aid you in attaining what you have made the object of your life, the solution of the long-vexed question as to the existence and position of ancient Troy. It is a story such as in these days of luxury and self-indulgence deserves, for the admonition of our youth, to be written in letters of gold, one that would teach them, if anything would, that success to be real must be the product of resolute hard work, and that nothing is denied to well-directed labour. That indefatigable industry such as yours, employed in the pursuit of commercial enterprise, should result in the acquisition of wealth is no uncommon thing; but that that wealth, so laboriously and honourably obtained, should without stint be freely expended on the realisation of the early aspirations of enthusiastic youth is a very rare and noble thing, and a most valuable lesson to all who are wise enough to ponder or have the generosity to practise it. I will not venture to detain you, sir, or this meeting, by speaking in detail of the great work you have been able to accomplish towards settling the controversy to which I have already alluded, which has so long occupied the minds of many learned men, like yourself Homeric enthusiasts; a controversy resulting in conflicts almost as dire as those we read of between the Greeks and Trojans of old. Your labours in this direction, and in the discovery of the Homeric tombs at Mycenæ, with the wealth of gold and bronze ornaments which were then brought to light, and your exploration of the remains of the Treasury of Orchomenos, have added a new chapter to the artistic history of Greece, the full value of which has perhaps not even yet been realised by archæologists, but the importance of which can hardly be overrated. Of your labours at Tiryns, and the discovery within the circuit of its well-known and long-celebrated Cyclopean walls, of the pre-historic palace, possibly older than anything at Mycenæ or Troy, but still retaining its wall-paintings and decoration, we know enough to make us look forward with lively interest to the publication of your forthcoming work, which we cannot but believe will add to the fame you have already acquired as one of the most liberal, undaunted, and successful labourers in the investigation of the unrevealed history of the past which this century has produced. Sir, I congratulate you very truly and heartily on the success you have attained, and with all humility, and yet with pride, rejoice to be the medium of presenting you with this medal, the well-earned acknowledgment of the distinction you have so honourably acquired by your disinterested labours.

Dr. SCHLIEHMANN: Mr. President and Gentlemen,—I receive with the highest possible gratitude the royal gold medal, and I am exceedingly proud of receiving it the more so as it is conferred on me by Her Majesty the Queen, at the solicitation of the Royal Institute of British Architects, because this most distinguished body eight years ago did me the high honour to elect me an honorary corresponding member. I felt at the time that this high distinction was quite undeserved; nevertheless, I felt very much flattered by it, and I have ever since done everything in my power to show myself worthy of it. Not being able to accomplish this by new inventions in modern architecture, which British genius has brought to the highest pitch of perfection and excellence, I thought I could not do better than use my pickaxe and shovel and make discoveries of architecture of the Heroic age, and solve the architectural problems which have puzzled the wisest of the wise among archæologists in all ages. In fact, our knowledge of prehistoric architecture was very deficient. All we had was the account of Homer, whose scanty information of the construction and the internal arrangements of the Homeric palaces we do not understand. I venture to hope that my excavations of the old historic palace of the former kings of Tiryns and the galleries in the walls, with their series of eleven ogival-like chambers, and the three other chambers we have lately discovered in the tower, will contribute greatly to explain to us the Homeric descriptions. I beg you to receive once more the expression of my profoundest gratitude.

#### Medals and Prizes.

The President distributed the prizes as follows:—

*The Pugin Travelling Studentship.*—The medal and the sum of 50*l.* was awarded to Mr. William Henry Bidlake, who would receive the same on his return from his tour, and after depositing his sketches, &c., made during that tour. The same remark held good in the case of the holder of the Godwin Bursary, Mr. John Bradshaw Gass. A medal of merit was next awarded to Mr. Herbert Osborn Cresswell, and a medal of merit to Mr. Thomas Maclaren.

*The Soane Medallion* (with 50*l.* to be afterwards paid under the usual conditions) was awarded to Mr. Arnold Bidlake Mitchell, a medal of merit to Mr. Alfred Arthur Cox, and also a medal of merit to Mr. John Thomson.

*The Tite Prize of Thirty Pounds and a Certificate* was awarded to Mr. John Archibald Campbell.

*The Institute Medal and Ten Guineas* for measured drawings was awarded to Mr. Ernest Albert Coxhead, a medal of merit and 10 guineas to Mr. James Cromar Watt, a medal of merit to Mr. John Holmes Greaves, a medal of merit to Mr. Arthur George Adams, and a certificate of honour to Mr. Thomas Locke Worthington.

#### Presentation of Portrait.

Mr. CHARLES BARRY formally presented to the Institute a portrait of Mr. Horace Jones, painted by Mr. Frank Holl, R.A.

On the proposition of Mr. GEORGE AITCHISON, a cordial vote of thanks was passed to Mr. Holl.

Mr. THOMAS M. RICKMAN read a paper, entitled—

#### Professional Lessons from a Boulder: a Plea for Geology as part of an Architect's Education.

The author described a particular boulder on the beach of Cardigan Bay, near the old castle of Crickieth. This boulder, besides having been split, had been roughly shaped by nature, had been weathered, coloured by the salt and spray, the lichen, the moss, and the sea birds. It was there to tell many things; for all form and all colour too were history, if we would but read it. Should it be said that the mere outline of a stone could but give results, whilst the outline of a building reveals a purpose, the objector might be reminded of the form of every shell found in stone as adapted to the continuation of the species of animal once inhabiting that shell. The series of outlines, all to scale, parallel to the hinge-joint of a bivalve mollusc, and not less the continuous lines radiating from the hinge, the same in infancy and through later stages of growth, every one of them was the development of the meaning of the form, like the delicate mouldings of a mullion curving through tracery. Let any architect study for a while the serried outline of such a shell, with every change of form and size in its life's history marked in the clearest manner, and he would learn a lesson in the adaptability of curves and shapes which would bring him back to the design proper for his mouldings, should he ever have been tempted to go astray. So, again, should he compare the devolution of allied genera in the matter of form, according to climate and life environment, he will come back, not uninstructed, to the use of his timber, brick, sandstone, limestone, marble, iron, or granite, but with the feeling that he has picked up ideas which it will be his business to turn to good account. By studying the forms of orthoceras, ammonites, and such newer births of geological time as the nautilus, by taking note of their mode of growing, straight or curved, or in coil, open, close, or involved, the outward form always corresponding with the position of the internal air-channel, the early years' growth of the individual still seen in the eye of the perfect and full-grown volute, the mode shown in which the internal coil bursts into the wide outer rim, the last formed aperture appearing in the natural termination of the antecedent convolutions, the professional aspirant would come back to his task of designing any curved architectural form with his eye refreshed by the sight of outlines full of meaning for him, and would not dare draw for the purpose of execution in stone, in wood, or in plaster any unmeaning shape. Let the architect contrast the elements of form to be seen in the bivalve shell and its hinge with those exemplified in the univalve on the one hand, and with those to be found in the multicellular shell on the other, and he will not fail to recognise distinctions of principle as great as can be traced in Classic architecture, of the most trabeated style, or in Gothic, the most arcuated. Nature's mode of working, said Mr. Rickman, was not like the plasterer's zinc mould horsed upon a straight-edge. The mould which shaped the shells was the soft pulp of the living animal in its perfect state, and repeated ever with more and more significance, and with a set of different sections, but all fitting the mould. And from such studies of nature the architectural instinct would come back to the examination of an antique building, and would penetrate the purpose of the designer. The purpose would be divined from the privacy of the dwelling, the indispensableness of the castle's inviolability, the worship celebrated in the church. The problem would be studied in the light of the improved political condition of the country, the cleanliness or filthy habits of the population, the current modes of offence and defence, the depth of the people's devotion. All these helped to clear up the artificer's aims. The history of a country was more to us than dates and names, and so the metamorphosis of an orthoceras into a nautilus conveyed to the mind ideas far greater than those of mere changes in stratification. To an architect the study of these changes revealed the growth of motive and the history of form. Such researches made him an engraver of the annals of his race. By seizing on the clues thus furnished by nature the course of architectural style would follow in the footsteps of political and race history, and architectonic forms would tell of the religion which had influenced the lives of the profession and its clients. Progress or retrogression in our buildings would be the test of

the education of the time. Whereas stones were mostly shaped by forces which it is the architect's business to control, the history of a boulder might help architects not only in the criticism of old buildings, but of their own works also, and so help in the formation of a really original style. The essayist urged that natural sciences, and especially geology, might fill the place for an architectural curriculum of the study of a dead language. Geology and language were each to be valued as a phase in the delineation of thought, of purpose, and of mind; language for the man of the day, geology for the architect, whose works were to tell to later eyes their own stone history.

On the proposition of Mr. E. Pansen, seconded by Professor T. Roger Smith, a vote of thanks was passed to Mr. Rickman, and the proceedings terminated.

#### SOCIETY OF ARTS PRIZE ESSAY.

SOME time since, the Council of the Society of Arts undertook to award in prizes for essays on "London Reconstruction" and the "Housing of the London Poor" a sum of 1,200*l.*, placed at their disposal by Mr. W. Westgarth.

The Committee appointed by the Council of the Society of Arts to consider the essays sent in for the above prizes, have reported to the effect that in their opinion none of the essays realise the requirements of the offer in such a manner as to justify them in recommending that the full amount of the prizes offered by Mr. Westgarth should be awarded. They recommended, however, that prizes amounting in all to 600*l.* should be awarded as under:—

Three prizes of 100*l.* each, to H. H. Bridgman, 42 Poultry, E.C.; J. Corbett, 24 Barton Arcade, Manchester; W. Woodward, 7 Duke Street, Adelphi, W.C.

Three prizes of 50*l.* each, to A. Wynter Blyth, Court House, St. Marylebone, W., and R. Greene, Berry Wood, Northampton; Clement Dunscombe, City Engineer, Liverpool; C. Scott, Town Hall, Belfast, and J. W. E. Tilley, Royal Avenue, Belfast.

Six prizes of 25*l.* each, to A. H. de Wind, Comber, Co. Down; J. S. Fairfax, 3 St. Paul's Road, Camden Square, N.W.; Victor Jetley, 8 North Audley Street, W.; T. E. Julian, 22 Palace Road, Roupell Park, S.W.; W. H. Newell, M.D., 201 Palisade Avenue, Jersey City, N.J., United States of America; G. W. Usill, Haldon Lodge, South Fields, Wandsworth, S.W.

The report and award has been accepted by the Council. The three essays to which prizes of 100*l.* are awarded will be published on behalf of the Society.

#### THE GUILDHALL CRYPT.

THE annual meeting of the London and Middlesex Archaeological Society took place on Tuesday at the Tallow-Chandlers' Hall, Mr. E. Knight, master of the company, in the chair, when a paper dealing with the history of the company was read by Mr. T. F. Monier Williams. A visit was paid to the church of St. Lawrence Jewry, which was described by the Rev. Louis Stokes as one of the best of Sir Christopher Wren's churches. One curious matter was that the Moorfields morass extended as far back as the church, and the architect was obliged to drive piles 12 feet long to the depth of 7 feet to get a foundation for the church on the north side. It was one of the most expensive of the churches built at that time, costing over 15,000*l.*, and taking nine years to build. A visit was then paid to the Guildhall and crypt.

Mr. A. White, F.S.A., said that the crypt, or undercroft, of most buildings was one of the most interesting parts, for many reasons. It told the better the history of the building above it than any other part, and this was particularly the case with the crypt they were now in. The portion they were in was a very small portion of the Guildhall, and extended under a small part of the east end of the hall. Whether the rest of the Guildhall had an arched crypt of this kind there were no means of determining. He would first say a few words upon the very peculiar locality in which they were, for one would have supposed that a great building like the Guildhall, the site of the government of the Corporation of London, would, at any rate, have been in one parish or in one ward. But one end of the Guildhall, that under which was the crypt, was in the ward of Bassishaw, in the parish of St. Michael, and the other was in the ward of Cheap. This was a matter of very great importance. They did not know whether the first hall stood upon this site, but Stowe had told them that it stood further to the westward, and that he remembered the ruins of the old hall in Aldermanbury. If that were the case, they met with another very curious local circumstance, because that would have been in the ward of Cripplegate. Therefore, if there were an ancient hall in that locality, it must have been one of very much greater antiquity than the present. Of that there was nothing whatever remain-

ing. On the south side of the Guildhall stood, as he could just remember, the chapel of the Guildhall. That was a building of very ancient foundation—certainly as early as before 1300; it certainly belonged to the thirteenth century. The building of the present hall did not commence until the year 1411; therefore, of course, there was a chapel there long before the present Guildhall was built. But there were indications of a more ancient hall than the present Guildhall. At the west end of the crypt there ran a very strong wall, evidently an external wall, and clearly not built as a partition wall; but it was an external wall, with every indication of an external doorway, and that the crypt was approached on that side. In the further part there were evidently no remains of anything at all like arcading; there were the springings of the arches, but no arched crypt carried out. There was another very great peculiarity in the crypt. He had examined very carefully a great many of the crypts of the great buildings of England in all parts of the country, and there was one rule to which he had found no exception. The crypt of domestic buildings had always a line of columns in the centre dividing it into two bays, and this was true even of the great hall of South Wingfield in Derbyshire, which was of a gigantic size. But he had found it to be an invariable rule in the crypts of all ecclesiastical buildings that there were two rows of columns down the centre, and that the crypt was divided into three bays, and this was the case with the crypt of the Guildhall. He believed that this crypt was not the crypt of anything built as a guildhall, but that it was the original crypt of the chapel of the Guildhall, and he believed that the chapel was in the parish in which they were, and not in the parish in which was the ancient Guildhall. Another important circumstance was that at the partial destruction of this hall in 1411 a very great deal of money was expended in rebuilding the chapel of the Guildhall. There could have been no reason for rebuilding the chapel simply because they were rebuilding the hall, and he believed that they wished to increase the hall to the eastward, and pulled down the old chapel, building a new one on the south side of the present hall. There were other reasons for this view. In pulling down the old chapel of the Guildhall some very interesting monuments were found, amongst them a slab which was now in the Guildhall Museum, to the memory of Geoffrey le Trompeur. This was an incised slab, which could not have been later than the thirteenth century, and therefore could not have belonged to a church, which, as he remembered it, was a building of the sixteenth century. Everything went to show that this was the site of the ancient chapel of St. Mary Magdalene, and that this was the crypt of the chapel itself. Another reason was that if it had been intended to have a crypt of this kind under the hall of Guildhall, it would have been carried out; but there was no evidence of any columns for the centre arches having existed. With respect to the style of the caps and bases of the columns, they were very much earlier than 1411. They belonged to a period certainly fifty, perhaps one hundred, years before. Another curious circumstance was that there was a doorway at the end, and up to a recent period there was a way out, even if it was a door of separation. Another reason was that drawings had been taken of all the bosses, and in a great many they were ecclesiastical subjects—monks and nuns and angels—such as were found in ecclesiastical buildings, and not in civil buildings.

#### THE NATIONAL COMPETITION.

THE thirty-second report of the Science and Art Department has been issued. In the report of the assistant-director for art, Mr. Bowler states that there has been an increase in the year of 10 schools and 1,124 students, who have worked successfully, as there is an increase in the numbers successful in every grade of examination and notably in the highest awards, those of the National Competition. The examiners of this competition were:—E. J. Poynter, R.A.; G. D. Leslie, R.A.; W. F. Yeames, R.A.; H. S. Marks, R.A.; J. E. Boehm, R.A.; Hamo Thornycroft, A.R.A.; W. Morris; G. Aitchison, A.R.A.; J. J. Stevenson, Professor W. C. Unwin, Walter Crane, Alan S. Cole, T. Armstrong, Director for Art; and H. A. Bowler, Assistant-Director for Art. The number of drawings sent up from schools of art for examination was 254,610 from 202 schools of art and branch classes. 1,339 third grade prizes were awarded for works in advanced stages which were passed forward for the National Competition. Those works only were exhibited in respect of which medals or Queen's prizes of books had been awarded. Eleven gold medals, 53 silver medals, 110 bronze medals, and 228 prizes of books were awarded. In addition honorary awards were made to students in training at South Kensington of 8 silver and 18 bronze medals and 31 book prizes. The gold medals were awarded as follows:—Four to Hanley, the subjects being modelled design for a vase, chalk drawing of figure from the nude, designs for majolica plaques and a painted vase, and modelled design for a flower-pot; two to Manchester (Cavendish Street), for designs for

calico printing and designs for printed cotton fabrics; one to Nottingham, for group in oil colours; one to Southampton (Hartley Inst.), for designs for carpets and models of the nude figure from life; and one to West London, for design for the side of a dining-room and decoration of a building.

The following observations on the subjects of study, exemplified in the works submitted for judgment, were made by the examiners for the information and guidance of masters and students in the schools.

*Drawings of Heads.*—In the drawings of large heads from nature there is a tendency to slovenly execution and extreme blackness, the differences of colour between the hair and the flesh are often too much emphasised, and the forms of the hair are hardly ever carefully rendered.

*Drawings from the Antique.*—No gold medal has been awarded in this class. A profile view of the *Fighting Gladiator*, which has obtained a silver medal, is the best of its class, but not up to the gold medal standard. Many of the drawings from the antique are messy and woolly in manner and have a tendency to extreme blackness.

*Drawings from the Life.*—The gold medal has been given with much satisfaction to a drawing from the Hanley School done in an excellent and thorough manner. It is one of the best ever sent up for competition, being remarkable for subtlety of outline and careful modelling. With a view to encourage extensive practice in drawing the figure among evening artisan students who are decorative workmen, and who have but little time for study, the examiners recommend that additional prizes be given in the same stage to students who, having already taken them for finished drawings from the life, may send up sets of smaller and less finished, though not careless, studies of figures in action from life. The examiners are of opinion that drawing of the figure from memory, both antique and living model, should be practised. They wish to point out that in decorative plaster-work or designs for pottery or for metal or woodwork, where the figure is introduced ornamentally, the level reached is much below that of the designs for floral decoration. They would gladly see more use made of birds and animals treated in a decorative spirit.

*Studies of Drapery.*—The studies of drapery arranged on antique figures, which the examiners were glad to see, are generally good, but one of them can hardly be counted as drapery, but rather as costume. Drapery implies an adaptation of folds to the figure. Many of the studies from pieces of hanging stuff are rather still-life pieces than studies of drapery. In some instances the colour of these stuffs is offensively startling.

*Modelling of Drapery.*—The examiners expressed much satisfaction with the modelled study of drapery sent from the Lambeth School, which in execution were both spirited and careful, and showed taste and judgment in arrangement.

*Modelling from Life.*—The works of Tonelli (South Kensington), to whom a gold medal has been awarded, were considered commendable, as being done in a careful and delicate manner with less of the showy execution and strongly-marked details which have obtained of late. Of three small figures sent from the Lambeth school, two were considered worthy of medals.

*Designs for Wall-paper.*—The designs for wall paper were, on the whole, poor and dull or rank in colour. Hardly any were light and gay, and very little invention was shown in them. An exception may be made in favour of one from the Manchester (Mech. Inst.) School of Art, which shows considerable ingenuity and good feeling for form.

*Designs for Tiles.*—The little scraps of pictorial, flower, and figure drawing sent up as tile designs are not at all decorative or ornamental in character, and almost in every case are bad in colour. Many of them are in fact studies of botanical specimens rather than suggestions derived from natural plants and worked out ornamentally, with due regard to the filling of the required spaces and the surface character of the tiles. The floor tiles are often wanting in dignity and sobriety of colour. The best among the designs for tiles is from the National Art Training School. Though the elements of this design are very simple, the combination is good and a pleasing pattern is obtained.

*Designs for Plaster-work.*—A silver medal has been awarded to a piece of work by Geo. W. Wilson, of the (Royal Architectural Museum) Westminster School of Art, in which the masses are well arranged and a good feeling for gradation of relief is shown. The examiners suggest that designers of plaster-work should not limit themselves to one or two styles. They might look with advantage to antique Roman work of the kind, or to that of the Jacobean and Elizabethan times in England. The modelled plaster-work shows more life and artistic feeling than usual.

*Designs for Gold or Silver Work.*—The examiners consider the designs for gold and silver work wanting in feeling for the beauty of the materials, and suggestive of a very mechanical kind of execution.

*Designs for Ironwork.*—The designs for ironwork, though

not very good, were considered better than those for gold and silver. In the drawings sent in of iron gates the designers seem generally to have confined themselves too much to a close imitation of the works of one short period.

*Designs for Carpets.*—In the drawings to which the gold medal has been awarded there is evidence that the designer understands the detail and knows how to make it suitable to the material. His work is well presented. The portion of the pattern shown on a large scale is well done, and invention is shown in the treatment, but he has erred in trying to give a sense of relieved moulding by shading. Some of the competitors, in giving only a very unimportant piece of the pattern full size, have failed to comply with the spirit of the rule.

*Designs for Cotton Prints.*—The examiners have seen with great pleasure a number of designs for cotton prints from the Manchester (Cavendish Street) School of Art—designs treated in a proper decorative spirit, and with due adaptation to material. The two gold medallists distinctly show invention in their works, and evidently understand the method of design for this material. It is obvious that there is much difference in the capacity of these students, and herein is seen evidence of intelligent teaching which is gratifying.

*Still-Life Painting.*—In the drawing of a geranium plant, to which a gold medal has been awarded, the crispness of the flower is admirable. The painting of the plant, and the understanding shown of its form and colour, leave little to be desired. The same may be said of its relation to the background, which, although very unsatisfactory in the matter of finish, is admirable in its subordination of tone and colour. The oil-painting which has gained a gold medal is done with great freshness and directness; especially is the gold vase to be commended, which has been executed with great care, but without needless and painful elaboration. In the silver medal still-life piece from Lincoln there is also a directness of method which is worthy of imitation. The examiners wish to point out that the arrangement or composition of the still-life groups ought to be more carefully considered, and that artistic and tasteful arrangement is taken into account in the awarding of prizes. They recommend that a gold medal be no longer given for this branch of study, which has of late occupied too large a place in the school course out of proportion to its educational value.

*Modelled Works.*—Two pieces of modelled work from Hanley, to which gold medals were awarded, have more artistic merit than is common among such works sent up for these competitions, and the examiners accordingly take higher ground in criticising them. The plaster model of a vase with a frieze of figures has great distinction in its contour, and there is a certain reserve or restraint in the relief which deserves praise, but it may be remarked that there is a slight discrepancy between the Renaissance character of the frieze and the linear decoration of the vase which is Greek in feeling. In the terracotta jardinière the figure looks a little thin and poor in juxtaposition with the massive base; in fact, the figures suggest metal-work, while the rest is suitable to the material actually used, terra-cotta. The ornament on the ends is somewhat monotonous in relief. In both these works considerable decorative sense is shown.

*Designs for Lace.*—The scheme of design for machine-made curtains remains very much as it has been for some years. The mere execution of the patterns for machine-made lace is as neatly carried out as ever, but there are no distinct signs of newness in invention. Hence the examiners were prevented from rewarding this class of work as highly as the designs for cotton prints, which indicated a new and praiseworthy development in this branch of designs and therefore called for commensurate marks of approval. In the designs for machine-made lace curtains the relation of the border to the filling is often wrong in scale, and the lines of separation between the border and the filling are not properly marked. Some of the designs for lace from Ireland have beauty of form and proper adaptation to the different processes of hand-manufactured lace.

*Drawings of Hands and Feet.*—The examiners would gladly see encouragement given to the drawing of hands and feet separately, such as those on a sheet sent from the Bloomsbury School. Studies from life are the best, but drawings done from good casts from nature are also useful.

*Architectural Drawing.*—In the architectural work is shown an appreciation of old examples, and a freedom from vulgarity and extravagance, which perhaps are of greater practical importance than originality. Carefully-tinted drawings of the lantern of St. Paul's from South Kensington have obtained several awards.

*Anatomical Drawing.*—For anatomical study methods which suffice to show a thorough understanding of the form ought to be encouraged rather than those which with much labour aim at a still-life treatment. The examiners wish to point out the want of a skeleton of good proportions. They recommend careful drawing of the bones where they are subcutaneous, and that knees and ankles, wrists and elbows, be especially studied.

*Drawings from Measurement.*—Two bronze medals and four book prizes were awarded to fully-shaded machine drawings. The three best of these indicated considerable power of dealing with difficult forms in isometric projection. The softness of artistic feeling in the two best drawings deserves great commendation. On the whole, the series of drawings of this kind sent up this year is more numerous and of better average quality than in either of the last two years. Of working drawings of machines there were no examples of any special merit.

A bronze medal was awarded for a set of drawings of building construction forming a very large and useful set of studies; a book prize was also awarded to a second set equally good in drawing but less extensive. Drawings of this kind belong to the stage in which a candidate is learning the use of his instruments, and taking this into account the two sets to which prizes were awarded may be regarded as excellent.

A book prize was awarded to a set of architectural drawings of a church of very great skill in draughtsmanship.

They appear to indicate the advantage to a student of seeing architectural drawings of a good style.

## ANCIENT MONUMENTS.

AT the annual meeting of the Society for the Protection of Ancient Buildings, held in the lecture-hall of the Society of Arts, Mr. William Morris, who presided, in moving the adoption of the report, which described the work done by the society in the past twelve months, said the question had passed through the domain of sentiment and got into that of business; and if the society went on long enough and stuck to its work doggedly enough it might save a few ancient buildings from destruction. In point of fact there was a kind of race going on between carelessness and ignorance on the one hand, and the amount of influence which that society could bring to bear upon public opinion on the other. The report presented in the main three classes of cases—first, cases which were gibbeted as examples of amazing stupidity in a country supposed to be educated; secondly, cases in which there were *pros* and *cons*, and they still had some hope of success; and thirdly, cases in which they had obviously done something useful. In the last year there was a greater number of cases of people requiring or accepting definite advice and help than had been before. After illustrating the work of the society by detailed mention of several churches and of the tower of Peterborough Cathedral, he said the defeat which the committee felt most keenly was that sustained in the case of Westminster Hall, and expressed his regret that, instead of the ancient remains of the old Hall, they were to have a new building in the nineteenth century based on Mr. Pearson's idea of what the Hall looked like in the latter part of the fourteenth century. He expressed similar regret with respect to Staples Inn, Holborn, and said the only suggestion he could make for its preservation was that some rich Englishman, or, better still, some rich Yankee, should make up his mind to buy the inn of Messrs. Pickford.

## THE INSTITUTION OF CIVIL ENGINEERS.

THE first annual general meeting under the revised by-laws passed last April, was held on Tuesday, June 2, 1885, the president, Sir Frederick J. Bramwell, F.R.S., being in the chair, when the report of the Council was adopted. There were on the books, at the end of March, twenty honorary members, 1,485 members, 1,932 Associate members, and 507 Associates, besides 843 students.

During the session twenty-four ordinary meetings were held, at which twelve papers had been read and discussed, and one other paper had been read, but its consideration was postponed till next term. For some of these communications the Council had awarded medals and premiums, as under:—A Watt medal and a Telford premium to Professor H. S. H. Shaw; a George Stephenson medal and a Telford premium to Mr. W. Stroudley; a Telford medal and a Telford premium to Mr. P. W. Willans; and Telford premiums to Mr. D. S. Smart, to Mr. A. Jamieson, and Mr. W. Shelford. The special thanks of the Council had been recorded to Messrs. Benjamin Baker and John Wolfe Barry, for the valuable descriptions they had given of the design and construction of the works of the Metropolitan and the Metropolitan District Railways. For papers to be printed in the proceedings without being discussed, a Telford medal and premium had been awarded to Mr. W. G. Brounger; Telford premiums to Professor W. C. Unwin, Mr. T. Andrews, Mr. J. G. Mair, and Mr. J. Craig, and the Manby premium to Mr. C. W. Kinder. There had been twelve supplemental meetings for students, at which as many papers had been read, and to eight out of the twelve papers Miller prizes had been awarded. The authors of the successful communications were Mr. F. G. Howard, Mr. H. H. Dalrymple-Hay, Mr. F. W. S. Stokes, Mr. H. T. Turner, Mr.

W. Kidd, Mr. S. R. Lowcock, Mr. E. J. M. Davies, and Mr. F. H. Hibblethwaite.

The ballot for Council resulted in the election of Sir Frederick J. Bramwell, F.R.S., as president; of Mr. E. Woods, Mr. G. B. Bruce, Sir John Coode, and Mr. G. Berkley as vice-presidents.

## Society of Arts.—Westgarth Competition.

SIR,—The following is a copy of correspondence with reference to the Westgarth Competition.

GEORGE W. USILL.

[COPY.]

Haldon Lodge, Southfields, Wandsworth, S.W. :  
June 6th, 1885.

H. H. Bridgman, Esq., 42 Poultry, E.C.

DEAR SIR,—I think it only right to inform you that, in the interests of the other competitors in the above, and myself, I have felt it necessary to draw the attention of the secretary of the Society of Arts to the unfair advantage you have taken of the awards to gain undue notoriety. Some of the competitors are out of this country, and surely *esprit de corps* should be a safeguard against abusing their absence.—I am, dear sir, yours truly,

(Signed) GEORGE W. USILL, Assoc. Mem. Inst. C.E.

42 Poultry, E.C. : June 8th, 1885.

SIR,—Replying to your communication of 6th inst., conveying the intimation that in your opinion I had taken unfair advantage of the award, you may not be aware that all the awards were published in the Journal of the Society of Arts of the 5th inst., and were consequently in print at the time I received intimation from the secretary. I therefore respectfully protest against your closing remarks.—Yours faithfully,

G. W. Usill, Esq. :

(Signed) H. H. BRIDGMAN.

Haldon Lodge, Wandsworth, S.W.

Haldon Lodge, Southfields, Wandsworth, S.W.  
June 8th, 1885.

H. H. Bridgman, Esq., 42 Poultry, E.C.

DEAR SIR,—Without any desire or intention of entering into a controversy with you upon the subject, in reply to yours of this date, I am bound to say that your justification (therein contained) of assuming the sole credit in the above, upon the grounds that you were the first to see the report in print (Society's Transactions) and to act upon it, is as unique as it is questionable.

Had you been the only recipient of the highest prize, it would even then have been in hardly good taste to single yourself out for notoriety. But seeing that there were two other gentlemen equally meritorious with yourself, with whom you are bracketed, simply because by alphabetical order you are placed first on the list, it is surely a breach of professional (if not ordinary) etiquette for you to take advantage of the fact.

Personally I have no interest in the matter, as you are all strangers to me, and, as you will see by the accompanying essay, I could never have hoped or expected to be in the first ranks, as I elected to treat the whole question from a general point of view. Notwithstanding, I feel that even the least of the premiated should have their fair share of any credit of having been successful in so large a competition.

I reserve the right to publish this correspondence.—I am, dear sir, yours truly,

(Signed) GEORGE W. USILL, Assoc. Mem. Inst. C.E.

## CHURCH BUILDING AND RESTORATION.

**Brighton.**—The building committee for the restoration of Queen's Square Church, Brighton, have issued further orders for the completion of the restoration from the plans and specification of their architect, Mr. Arthur Loader, 54 Old Steine, Brighton, and the builder is Mr. John T. Chappell, of 149 Lupus Street, London, who is about to commence the work at once.

**Halifax.**—The church of St. Anne-in-the-Grove, which has been remodelled from the designs of Mr. W. Swindon Barber, has recently been reopened. The greater part of the interior work, including the brass lectern and black wrought-iron gas-fittings, were supplied by Messrs. Jones & Willis, of Birmingham and London.

**Hereford.**—The church of Holy Trinity, Whitecross, has been opened. The nave, north and south aisles, and south porch only have been completed, but the foundations for the remainder of the structure have been put in, including those for the tower and spire, and the work will be done as soon as funds are available. On its completion, the church will accommodate about 700 people, and the style of architecture is Early English. Messrs. Godwin & Son, of Lugwardine, gave the whole of the tiles for the floor. Messrs. Warwick & Hucksion have carried out the contract, and the plans were designed by Mr. F. R. Kempson.

### NEW BUILDINGS.

**Alsager.**—The foundation-stone of new parish schools has been laid. The cost of the land, schools, and fittings will be from 1,500*l.* to 1,600*l.* The architects are Messrs. Paley & Austin, of Lancaster, and the contract is being carried out by Mr. Gratton, of Alsager.

**Bristol.**—Messrs. Edwards, Ringer & Co.'s new premises in Redcliff Street are just approaching completion. The building has been constructed from designs by the late Mr. J. H. Hirst, and carried out under the joint supervision of the son, Mr. H. C. M. Hirst, and Mr. H. Crisp, architects. The front elevation was designed chiefly by Mr. H. C. M. Hirst, from ideas suggested by his late father. The treatment is Italian throughout. This frontage in Redcliff Street consists of well-arranged shops, with all necessary store-rooms. The central entrance to the works is of unusual width. Close upon the entrance gates are two handsomely-constructed offices, projecting a little out of the line of the frontage, but not sufficiently far to spoil the effect of the double staircases and galleries at the further end, which communicate with every part of the building, and were supplied by Messrs. MacFarlane, of Glasgow. This same entrance forms a hauling way, and extends from the front to the back of the building. This is considered an important feature in the arrangements of the building, both with regard to ability and the appearance of the structure. Being open throughout to the top of the building, the place is admirably lighted, the roof being composed entirely of glass fitted in iron framework. The first rooms on the right-hand side of the ground floor form very commodious offices for the clerks, and there is also a private staircase leading to the offices of the accountants. Further on are the kitchens and other rooms provided for the workpeople at meal times. The remainder of the ground floor, as well as the two upper storeys, are intended entirely for the manufacture of cigars and tobacco. A detached building, in which the manufacture of snuff is to be carried on, will soon be completed. The whole building is as nearly as possible a square of about 130 feet. The front part is of Mansfield stone and granite plinths; the carving is by Mr. J. Steele, 13 Kingsdown Parade. The manufactory is built in a substantial style of white, red, and blue Cattybrook bricks. The whole of the flooring is fireproof, and was laid by Messrs. Dennett & Ingle, Whitehall, London, who also provided the ironwork for the central hall and roofing. The factory will be heated throughout by the steam apparatus supplied by Mr. Hodges, Temple Street, Bristol. The general contractors were Messrs. Stephens & Bastow. The clerk of works was Mr. George Salmon. The plumbing and gasfitting were entrusted to Messrs. Jones & Hudson, Redcliff Street. Mr. C. H. James, C.E., will superintend the arrangement of the new machinery.

### ARCHÆOLOGY.

**Society of Antiquaries of Scotland.**—The concluding meeting of the session was held on Monday in Edinburgh. The first paper read was a notice by Mr. J. Dalrymple Duncan, F.S.A.Scot., of a small local cemetery of the Bronze Age discovered at Uddingston, near the bank of the Clyde at Kylepark. In excavating for the construction of a road two urns were found about 12 inches under the surface. One measures 12 inches in height by 9½ inches diameter at the mouth, and the other 13¾ inches in height by 11 inches diameter at the mouth. The first is ornamented with a band of zigzags between two bands of horizontal lines impressed in the soft clay by a twisted cord. The second is more ornate in character, having a boldly ornamented portion underneath the rim of zig-zag mouldings and bosses implanted on the surface, while the interior of the rim is ornamented by a series of mouldings with circular indented markings at intervals. Fragments of a third urn were also discovered. The urns, though much broken, have now been reconstructed and presented to the National Museum by Mr. R. Thomson, architect, Glasgow.

### GENERAL.

**At the General Assembly** of the Royal Academy, Mr. Alfred Waterhouse was elected a Royal Academician and Mr. Henry Moore, painter, Mr. E. Burne Jones, painter, and Mr. J. W. Waterhouse, painter, were elected Associates.

**The Façade** of the royal palace at Naples is to be embellished with statues of former sovereigns, representative of the history of the kingdom, and the work will be executed by Neapolitan sculptors.

**Mr. E. Bancroft**, of the Manchester Academy of Fine Arts, has been elected a member of the Liverpool Water-colour Society.

**The Royal Dublin Society**, at their annual meeting last week, resolved to hold an International Exhibition of Arts and Industries on an extensive scale, at Ballsbridge, in 1887.

**Messrs. Morley & Woodhouse**, architects, of Bradford and St. George's Road, Bolton, have changed their Bradford offices from 15 Darley Street to 269 Swan Arcade.

**The Trustees** of the funds of the British Institution contemplate giving the money, about 20,000*l.*, to the National Gallery and the National Portrait Gallery.

**At a Meeting** of the Council of the University College, at Aberyswith, held on the 9th inst., Mr. J. P. Seddon was formally appointed architect for the completion of the college buildings.

**Mr. T. Stopher**, architect, of Winchester, who was appointed arbitrator in the case of an action for damages claimed by Mr. Wignall against Mr. Leach, the owner of a house in Queen Street, Portsea, for injuries to his premises in consequence of defendant having, by digging a cellar, undermined his property, has just given his award, ordering defendant to pay damages to the amount of 50*l.*, together with the costs of the action.

**Messrs. Sugden & Blood** will act as joint architects along with Messrs. Chapman & Snape in the preparation of amended plans for proposed baths and free library at Newcastle-under-Lyme.

**The Newbury District Field Club** made their first excursion this year, and paid a visit to Lambeth Palace and Westminster Abbey, under the leadership of Mr. Walter Money, F.S.A. Mr. Kershaw, M.A., showed the party over the library at Lambeth Palace.

**The Bishop of Worcester** has contributed 100*l.* towards funds which it is hoped may be raised for preserving the old Grammar School at Coventry from destruction, as the building is shortly to be vacated for new school buildings.

**Mr. W. St. Chad Boscawen** on Wednesday opened his third course of afternoon lectures on the "History and Antiquities of Assyria and Babylonia."

**The Old College** of Glasgow, dating from 1632, and which has for several years served as the North British Station, is now being taken down consequent on operations connected with the construction of the underground railway.

**The Memorial Library, Stratford-on-Avon**, has received a presentation from the Record Office of nearly three hundred volumes, consisting of Calendars of State Papers, many of them contemporaneous with the life of Shakespeare and the subjects which form his historical plays. Many of the books have illuminated *fac-similes* of the original documents from which the records are printed.

**The Northampton Rural Sanitary Authority** have decided to prosecute a builder for infringing the by-laws in the erection of certain houses, as there is a strong disinclination on the part of builders to conform to the building regulations.

**The Darlaston Local Board** have appointed a committee to inspect neighbouring towns and report as to the cost of erection of public buildings for the town.

**In the Aberdeen Police Court** a builder has been fined, with the alternative of four days imprisonment, for having erected a building before having given notice or lodged the plans as required by the Police Act.

**Society of Arts Medals.**—The Council of the Society of Arts have awarded the Society's Silver Medals to the following readers of papers during the session 1884-5:—To Anton Jurgens, for his paper on "The Preparation of Butterine"; to P. L. Simmonds, for his paper on "Present and Prospective Sources of the Timber Supplies of Great Britain"; to A. J. Ellis, B.A., F.R.S., for his paper on "The Musical Scales of various Nations"; to Thomas Wardle, for his paper on "Researches on Silk Fibre"; to H. H. Johnston, for his paper on "British Interests in East Africa, especially in the Kilimanjaro District"; to E. C. Buck, for his paper on "The Agricultural Resources of India"; to Mancherjee M. Bhow-naggee, for his paper on "The Present Condition and Future Prospects of Female Education in India"; to Dr. Frederick Siemens, for his paper on "Tempered Glass"; to Frederick J. Lloyd, for his paper on "The Chemistry of Ensilage."

**The Albert Palace**, a structure used for the National Exhibition opened in Dublin in 1872, has been erected at Battersea, and was opened by the Lord Mayor on Saturday last.

**The Official Liquidator** of Wells & Company (Limited), Mr. W. S. Oxborrow, of the firm of Oxborrow & White, public accountants, 57 Cheapside, E.C., has obtained the authority of the Court of Chancery to pay a first dividend of 1*s.* in the pound to creditors, and cheques are now being issued.

**The Derbyshire Archæological Society** on Saturday paid a visit to Tutbury Castle, an historical building which, though the date of its first erection is uncertain, is known to have served as one of the residences of King Ethelred.

A Business Supplement

# The Contract Reporter.

to The Architect.

LONDON, JUNE 13, 1885.

## SKELDERGATE BRIDGE, YORK.

At a special meeting of the York City Council on Monday, the Skeldergate Bridge Committee reported the conclusion of the long-pending arbitration between the Corporation and Messrs. Handyside & Co. (Limited), the contractors for the ironwork of the Skeldergate Bridge. Originally by the contract, dated November 20, 1877, the contractors undertook to execute the work according to their specifications for the sum of 8,463*l.*, subject to the usual conditions as to additions or subtractions. The structure, however, was so materially altered that the clauses as to additions or subtractions became altogether inapplicable, and, in the result, the contractors sent in a total claim of 10,208*l.* 12*s.* 11*d.*, or 1,745*l.* 12*s.* 11*d.* beyond the sum named in the contract. In the meantime the contractors had been paid on the certificates of Mr. Page, the engineer of the Corporation, 6,500*l.*, leaving a difference of 3,706*l.* 12*s.* 11*d.* Of this sum Mr. Page was willing to certify to the amount of 1,933*l.* 7*s.* 6*d.* only, thus leaving 1,777*l.* 5*s.* 5*d.* in dispute. The matter had been referred to Colonel Haywood, the surveyor of the City of London. The illness of Mr. Page had precluded his being called as a witness on behalf of the Corporation, to explain and justify his disallowances from the contractors' bill. In this emergency the Town Clerk obtained the assistance of two eminent engineers. Colonel Haywood published his award on March 24, which was 4,056*l.*, or 347*l.* 7*s.* 1*d.* in excess of the claim, and the Corporation to pay the costs of the inquiry. The Council were asked to sanction the payment of the fees of the arbitrator, which were 24*l.*, and a few small charges to witnesses.—Mr. J. Brown, in moving the adoption of the report, gave the Council figures showing that the total cost of construction of the bridge had been 65,000*l.* or 66,000*l.*, which was certainly double the amount it was thought the bridge would cost. Since 1882 they had paid off 7,485*l.* of the loans originally borrowed. The first rate had produced 2,162*l.*, the second rate 2,194*l.*, and the third rate (up to March 25 last) 1,628*l.*, leaving a balance of 422*l.* yet to be paid by the collector. The latter rate was laid a year and a quarter ago, and he could not understand why the amount of 422*l.* should remain unpaid, to the detriment of the Council and the loss of the citizens. The tolls received from the bridge had fully come up to the anticipations of those who had advocated the construction of it, and there was no doubt they would continue to increase. The amount received up to March 25 was 6,396*l.* 19*s.* 3*d.* Instead, however, of having a balance at the banker's, the balance against them on revenue account to March 25 was 4,833*l.* 17*s.* 3*d.* They had, however, fifty years to pay off the debt, and the matter would become easier year by year. The Finance Committee desired in a short time to reduce the 3*d.* rate which had been put on the city since the opening of the bridge to 2*d.* He thought they would be able to afford it.—Ald. Rooke seconded the adoption of the report, which was carried without dissent.

## COMPETITIONS OPEN.

**BOURNEMOUTH.**—Aug. 19.—Designs are invited for the Construction of Two Marine Piers. Mr. G. R. Andrews, Town Surveyor, Bournemouth.

**BRISTOL.**—July 20.—Designs are invited for the Erection of Board Schools, Castle Green, for 1,000 children. Mr. Benjamin Wilson, Clerk to the School Board, Guildhall, Bristol.

**NORTHFLEET.**—June 23.—Plans are invited for the Erection of Schools to accommodate 200 Boys, 150 Girls, and 150 Infants. Mr. Fred. Mitchell, 49 Windmill Street, Gravesend.

**LIVERPOOL.**—Aug. 1.—Designs are invited for the Erection of Dwellings for the Labouring Classes. Mr. G. J. Atkinson, Town Clerk, Municipal Offices, Liverpool.

## CONTRACTS OPEN.

**ABERCARN.**—June 20.—For Erection of Shop and Two Dwelling-houses. Mr. David Davies, Architect, Club Chambers, Pontypool.

**ABERDEEN.**—June 13.—For 27 Tons of Channel and 55 Tons of Flat-bottomed Railway Rails, for the Town Council. Messrs. Jenkins & Marr, Architects, 16 Bridge Street, Aberdeen.

**ACKLINGTON.**—For Supply of Iron or Steel Boiler—Length, 28 feet; Diameter, 7 feet; Two Tubes, 2 feet 9 inches Diameter, with three Galloway Tubes in each. Bromhill Colliery, Acklington, Northumberland.

**ABERYSTWICH.**—June 18.—For Building Infirmary. Mr. E. M. Bruce Vaughan, Architect, Borough Chambers, St. Mary's Street, Cardiff.

**AMBLE.**—June 16.—For Erection of Co-operative Store Buildings. Messrs. Oliver & Leeson, Architects, Newcastle-on-Tyne.

**ARMAGH.**—June 27.—For Building Manse and Offices, for the First Presbyterian Congregation. Mr. J. H. Fullerton, Architect, Armagh. Quantities by Mr. E. N. Banks, C.E., Chichester Street, Belfast.

**BALLINASLOE.**—June 17.—For Building Day-rooms at Lunatic Asylum. Mr. T. Latimer, Secretary, Board of Control, Custom House, Dublin.

**BATLEY.**—June 15.—For Building Dwelling-house. Mr. J. T. Law, Architect, 64 Commercial Street, Batley.

**BECKENHAM.**—June 29.—For Construction of Seventeen Automatic Flushing Tanks and 4,000 feet of Pipe Sewer. Mr. G. B. Carlton, C.E., Surveyor to the Board, Beckenham.

**BEESTON.**—June 13.—For Rebuilding St. Mary's Church. Mr. C. H. Thornton, Architect, 3 Park Row, Leeds.

**BELFAST.**—July 1.—For Erection of Mission Hall. Mr. Henry Seaver, B.E., Architect, 35 Royal Avenue, Belfast.

**BILBAO.**—June 26.—For Building Theatre. Messrs. Yeves & Co., 24 Fenchurch Street, E.C.

**BIRKENHEAD.**—June 19.—For Building Purifying House at the Gasworks. Mr. T. O. Paterson, Gas Engineer, Birkenhead.

**BIRMINGHAM.**—June 17.—For Construction of Goods Warehouse. The Secretary, Euston Station.

**BISHOP AUCKLAND.**—June 17.—For Construction of Passenger Station. Mr. William Bell, Architect, Railway Offices, Northgate, Darlington.

INTERNATIONAL HEALTH

3 Silver and 4 Bronze Medals

[Telephone No. 3,525.  
EXHIBITION, 1884.

Awarded for Sanitary Appliances.

# HENRY CONOLLY.

LIMITED,  
MANUFACTURING SANITARY ENGINEERS,

Call the attention of Architects, Surveyors, and Builders to their Closets, the advantages of which will be readily seen by the accompanying Illustration.

## THE "SAFETY" VALVE WATER-CLOSET,

WITH

Conolly's Reversible Trap (Patent No. 3,754).

This drawing illustrates an improvement in the trap of a Closet, which admits of the outlet being placed in any position to suit the soil-pipe. This object is attained by means of a collar, which is similar in shape to that of an ordinary Valve-Closet. The base of the collar being round is flanged A; this is attached to a corresponding flange B, formed on the end of Trap by means of screw bolts, and from the drawing it will be seen that the outlet can be fixed in any position. It is obvious that this system can be adopted in every case where a separate Trap is employed.

The "Safety" Valve Water-Closet, like the "Nestor" as regards the Basin, is made with a cast lead trap above the floor line. The Trap is constructed so that the water-line is within 1½ in. of the seating of the Closet; therefore it will be seen if there become any defect in the indiarubber seating, the trap still remains sealed; by this means the necessity of a ventilating pipe is also dispensed with, also the old system of having a weeping pipe from the supply to the Lead Trap fixed in the box of Closet, there being no space for the generation of gases. The overflow arm is also protected from the possibility of soil corroding the edge of pipe, as the clack is made to open against it.

CAN BE SEEN IN ACTION IN NEW SANITARY SHOW-ROOM.

53 & 55 Hampstead Road, 169 & 171 Drummond Street.  
WAREHOUSES—TOLMERS SQUARE, N.W.

Disinfecting Fluids, Powders, Soaps, Ointments, Furniture Cream, Fumigators, &c., &c.  
AS SUPPLIED TO 600 PUBLIC HEALTH BODIES.

The Sanitas Co., Limited, Bethnal Green, E.

## GRUNDY'S PATENT WARM-AIR VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.

## TESTIMONIALS.

"9 Victoria Chambers, Westminster, S.W.

"June 10, 1884.

"SIR,—I have much pleasure in testifying to the efficiency of your patent Warm-Air Fire Grate. It has been very successful, and given every satisfaction where I have used it.  
Yours, &c.  
JAMES WEIR, F.R.I.B.A."

"To Mr. Grundy. JAMES WEIR, F.R.I.B.A."  
"Baptist Chapel, Clapham Common, London. Richard Webb, Pastor, 10 Grafton Square.

"February 15, 1884.

"DEAR MR. GRUNDY,—I have pleasure in testifying to the excellency and efficiency of your patent Fire-Grate. It is the most charming invention for heating a large room I have ever known. I shall have pleasure in showing it to anyone who wish to have their schools or rooms pleasantly and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool, July 1884.

"DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public.  
"Mr. John Grundy."  
From Hon. and Rev. G. G. C. Talbot, M.A., Withington Cheltenham.

"DEAR SIR,—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen.  
"Mr. John Grundy."

From F. J. Yates, Esq., Architect, Birmingham.  
"The best of the kind I have seen. I shall have pleasure in securing their adoption whenever opportunity offers."

Apply to JOHN GRUNDY, 30 Duncan Terrace, City Road, London.  
Works—TYLDESLEY, near MANCHESTER.

**VENETIAN ENAMEL MOSAIC****FOR MURAL DECORATION.**

Mosaic Works conducted on the same principle as in Venice and Rome by

**A. CAPPELLO,**

472 KING'S ROAD, CHELSEA, LONDON, S.W.

Established in 1880.

15 YEARS IN ENGLAND WITH DR. SALVIATI.

The above Factory is established in London for the purpose of making the Venetian Enamel Mosaic Work an English trade, and to reduce the cost to half the price that has been hitherto charged abroad or by the London agents.

See "Building News," Oct. 12, 1883, in reference to the Mosaic Pictures for the new Church of the Brompton Oratory, executed by this Establishment.

Gold Enamel Mosaic Work at 15s. per sq. ft.  
Venetian Enamel Mosaic Figure Work at 20s. per sq. ft., including expenses of Fixing.

**MOSAIC PAVEMENTS.**

TO  
**ARCHITECTS, BUILDERS,  
AND  
CONTRACTORS.**

**STEEL CUT NAILS!!**

The modern and important discovery in the process of making Steel has so reduced the price, that Steel Cut Nails of the well-known "Mitre Brand" can now be supplied at only 1s. 6d. per cwt. more than the price of the ordinary Common Iron Cut Nails.

The Steel Cut Nails are far superior in quality and more uniform in size than any wrought or hand-made Nails yet produced, and being lighter in weight than ordinary Iron Cut Nails and free from rust, they are found cheaper in actual use than common Iron Cut Nails at 1s. 6d. per cwt. less.

These Steel Cut Nails are specially suited for Builders, Joiners, Coopers, Packing-Case Makers, &c., and a single trial is sufficient to convince any one of their superior quality and cheapness.

**PATENT WROUGHT STEEL NAILS.****OVAL WIRE NAILS.**

Ask your Factor or Ironmonger for  
"MITRE NAILS."

## NOTICE OF REMOVAL.

# BELLMAN'S PATENT GULLY.

This Gully possesses the following advantages:—

**Receives and disconnects one Rain-water Pipe and Three Waste Pipes.**

**Avoids all Splashing.**

**Forms Drain for Area or Surface.**

**Ventilates the Pipes and Trap. Is easy of Access for Clearance.**

The ordinary P or S trap to be used in connection with Gully being in a separate piece, can be placed at any angle to meet the drain exactly, thus insuring a perfect joint, the Gully being fixed at right angles. This is a great advantage over other arrangements made with the trap in one piece.

The Holes for Rain-water Pipes are made both Circular and Square and of various sizes.

DESCRIPTIVE CIRCULAR ON APPLICATION.

**THIS GULLY IS HIGHLY RECOMMENDED by Authorities on Sanitary Matters.**

PRICE AT DEPOT:—EDWARD ST., DORSET SQUARE, N.W., 8s. 6d. each.

Also SINGLE GULLIES, for Sink Wastes only, price 3/9 each.

**TRADE NOTES.**

A STAINED-GLASS window has been erected on the north side in the chancel of the parish church, Machynlleth, in memory of the late Marquess of Londonderry. The tracery work is of Cefn stone. The glass was supplied by Mr. Alexander Gibbs, London. The stone came from Messrs. Chatham, Jones & Co., Ruabon. Mr. David Gillart, surveyor, Machynlleth, superintended the work. The masonry was executed by Mr. Edward Edwards.

At a meeting of the Council of the Wolverhampton Chamber of Commerce on Friday last week, it was announced that the South Staffordshire Railway and Canal Freighters' Association had taken up a scheme, involving an expenditure of one million sterling, for deepening the Great Junction Canal between Birmingham and London to allow of the passage of steamers of 120 tons burden. The Association have decided to order a survey of the route.

WE have just received a very fine sheet of designs of tile hearths from Webb's Worcester Tileries Company. These hearths are being exhibited at 10 Baker Street, Portman Square, where the stand from the late Building Exhibition, at the Agricultural Hall, has been permanently erected. The tileries are now under the management of Mr. John Harvey, by whom many alterations and improvements have been made in the manufacture of the well-known specialities of the firm.

MESSRS. GEARY & WALKER, of 7 John Dalton Street, Manchester, have been instructed to lay their patent "Premier" system of wood-block flooring at premises in Kirkgate, Bradford, to be used as a restaurant; parish church, Wednesbury, now being restored; church of St. John, Stonefield, near Accrington; schools for Sisters of Mercy, Dublin; Wrockwardine Schools, Wellington, Salop, &c. This firm have recently laid their flooring at the Royal Eye Hospital, Manchester; new post-offices, Doncaster; St. Chad's Church, Liverpool; Burnley Workhouse, offices at Hull, and the hospital at Bromley, Kent. WE

February 1885.

have described Messrs. Geary & Walker's patent system in previous issues.

A MEMORIAL mural tablet, erected by the congregation of Free St. Cuthbert's, Edinburgh, to the late Sir Henry Moncreiff in the vestibule of the church, has been unveiled. The tablet measures 5 feet by 3 feet, and is of plain Sicilian marble. The design is Gothic. In an indented circle in the centre of the tablet a bust of statuary marble in full relief is placed. The tablet was designed by Mr. Hippolyte J. Blanc; the Sicilian marble-work was executed by Messrs. Johnston & Davidson, architectural sculptors; and the bust, which is a copy of one which stood in the Academy last session, was entrusted to Mr. Hutchison. Mr. Blanc drew up the design. The total cost was about 100*l*.

### SANITARY INSTITUTE OF GREAT BRITAIN.

AN examination of local surveyors and inspectors of nuisances under the Sanitary Institute of Great Britain, at their rooms, 74A Margaret Street, Regent Street, W., took place on June 4 and 5. Twenty-five candidates presented themselves, nine as local surveyors, and sixteen as inspectors. Questions were set to be answered in writing on the 4th, and the candidates were examined *viva voce* on the 5th. The Institute's certificate of competency to discharge the duty of local surveyors was awarded to William Fraser, J. A. Angell, and J. Houghton, and to discharge the duties of inspectors of nuisances to James Bateman, Edwin Sortwell, George Wilson, James Skinner, J. H. Beel, J. T. Hawkins, J. Tait, Ralph Thomson, J. Pearson, Colin G. Mitchell, T. Lowther, W. S. Hart, T. D. Gratz, and James Bastiman. The questions were as follows:—

#### Paper I.—Local Surveyors.

1. State the principal provisions of the Public Health Act of 1875. Is it applicable to the whole country? Has it been modified by subsequent legislation, and, if so, how?

2. What power does a sanitary authority possess with regard to making by-laws?

3. If asked to advise upon the projected drainage of a town, what would be the chief points to which you would in the first place direct your attention? Explain what would be the conditions which would limit your choice of outfall.

4. What is the best method of sewage removal for rural districts? Give your reasons for your preference.

5. Where a cesspool for the reception of filth—solid or liquid—is unavoidable, what precautions should be taken in respect of—(a) Its position? (b) Its ventilation? (c) Its connection with house drains? (d) Its general construction?

6. How much sewage would pass in twenty-four hours through a sewer of 8 inches diameter, running full, laid at an inclination which would give a velocity of 3 feet per second; and what population would this sewer suffice for in a town with a public water supply, where the rain and surface water, other than that from the roofs and paved yards of houses, is carried off by a separate system? Give your calculation in full.

7. If you are called upon to report whether the connections of the drains of a house with the sewer have been properly made, in a town which has adopted the model by-laws of the Local Government Board, to what points would you more particularly direct your attention? Illustrate your answer by sketches.

#### Paper II.—Local Surveyors.

8. Having to advise as to supplying a town with water, how would you proceed to examine the surrounding district, and what data would you collect for the purpose?

9. What quantity of water would a steam-engine of 12 horse-power (effective) raise 50 feet high in twelve hours? What would it cost per annum to work such an engine under the above conditions, coals being 13*s*. 4*d*. per ton, working six days of twelve hours each, a week?

10. What steps would you take to detect

and remedy any waste of water in your district?

11. What provisions would you suggest for stopping the damp from penetrating through the basement walls and floors of a house which is to be built on a damp soil, and with its floors 4 feet below the surface of the ground? Illustrate your answer by a section.

12. What are the points to be considered in providing efficient ventilation? Give examples, with details as to size and arrangements—(a) For sleeping-rooms? (b) For living-rooms? (c) For workshops?

13. Make a sketch of, and describe in detail the materials, construction and drainage of a road to be made in a district where the ground is of soft deep clay.

#### Inspectors of Nuisances.

1. What are the provisions of the Public Health Act with regard to the exposure of infected persons and things?

2. Mention the rules in the model by-laws with reference to common lodging-houses. What should guide the Inspector of Nuisances in his examination of premises under the Public Health Act?

3. Define over-crowding, and explain how you ascertain if rooms are over-crowded. In the accompanying sketch showing the plan of a room which is 12 feet high, what is the cubic space, and how many people would you allow to sleep in it?

4. If an offensive smell is complained of at a scullery sink, how would you investigate the matter, and what remedies would you suggest? Give two or three examples.

# THE GREAT PROBLEM OF THE XIX<sup>TH</sup> CENTURY. VENTILATION WITHOUT DRAUGHT SOLVED.

The hitherto unsolved problem of "Ventilation Without Draught" is to be seen practically illustrated at FREDERICK HENRY SMITH'S Test Room, No. 68, 52 Queen Victoria Street, E.C., Patentee of the Automatic Siphonic Aspirator System of Ventilation. A personal inspection invited.

*Extract from the Annual Report of the "French Hospital and Dispensary," issued 29th January, 1885.*

We have also to return our best thanks to Mr. Smith, who undertook gratuitously to repaint one of our wards and to apply a new system of ventilation of his own invention, which was very successful.

*Letter from David Urquhart, Assistant Engineer to Colonel Sir Francis Bolton, C.E.*

F. H. SMITH, ESQ., 52 QUEEN VICTORIA STREET, E.C., and 4 THE SANCTUARY, S.W., LONDON: NOVEMBER 22nd, 1884.

In reply to your inquiry, I have much pleasure in certifying that your system of ventilation as applied to the "Island Room" of the illuminated fountains at the Health Exhibition reduced the temperature during the displays from about 110 deg. to about 70 deg., and thus enabled the men to perform their duties without inconvenience.—Yours faithfully,

DAVID URQUHART.

*Extract from the TIMES of March 14, 1885, page 7.*

"VENTILATION WITHOUT DRAUGHT.—This desideratum appears to be accomplished by a syphonic system devised by Mr. Frederick H. Smith, at whose offices, 52 Queen Victoria Street, London, we recently inspected the arrangement. The air supply is conducted into the apartment from the external atmosphere by means of air ducts, which terminate in distributing passages at the floor level. The exit for the vitiated air is placed in the ceiling, and consists of two tubes, a large and a small one, running parallel to each other between the floor joists in the case of rooms having others over them. In the case of rooms on top floors, or those having the roof directly over the ceiling, the tubes are placed concentrically, but the action and results are the same. The larger of the two tubes carries off the vitiated air, while the smaller one forms an induction tube for cold air, its outer extremity being open to the atmosphere. These two tubes or conduits are so connected that the passage of the heated air through the larger tube induces a current of cold air through the smaller one in a continuous stream. The result is a rapid clearing away of all deleterious gases and products of combustion as they accumulate, and the preservation of a pure atmosphere at an equable temperature in the apartment. In a small room at Mr. Smith's offices in which five large gas-jets were burning, the atmosphere was apparently quite innocuous at the level of about 7 feet, the temperature being about 60 deg. Fabr. At a higher level, however, and especially near to the ceiling, the temperature was high and the air greatly vitiated. It was demonstrated that this vitiated air was being drawn off through the exit tube, which acted as a powerful sucker. After turning off the gas-burners, and upon the temperature of the room generally becoming lowered and equalised, a feeble upward action was still maintained in the upcast tube, but there was no down-draught whatever. The system has already been applied to a church and other buildings with acknowledged success."

5. In what circumstances is it necessary to have butts or cisterns for the storage of drinking water, of what materials are they usually made, and in what ways may the water in them become contaminated?

6. State what constitute nuisances in respect of—(a) Smoke? (b) Smells? (c) Noise?

7. How would you deal with a nuisance arising from an accumulation of—(a) Refuse from a dwelling-house? (b) Trade refuse?

8. How would you proceed to disinfect a house in which a case of typhus fever or small-pox had occurred?

### BLACKBURN'S PATENT DUPLEX VALVES.

A USEFUL and efficient apparatus has been brought out by Mr. Henry Conolly, of 53 and 55 Hampstead Road, N.W., in the shape of a duplex valve, or, to speak more correctly, valves—one being the duplex ball valve, and the other the duplex bib valve. Among the advantages possessed by the apparatus is that waste of water is absolutely prevented. It can be taken to pieces, repaired, and refitted without interrupting the supply of water or steam in the pipe to which it is attached. The washer can be renewed or the valve ground in at any moment, and thus continuous leakage is out of the question, whereas ordinary taps frequently are allowed to drip month after month, seeing that to stop the leakage would necessitate stopping the water-supply till the evil was remedied. The construction is very simple. It is a gland-cock and screw-down valve combined, but the gland-cock is only brought into use when it is desired to examine or repair the valve. In the lower part of the body is a hollow plug, having an aperture at the side and open at the top in the bib tap, and at the bottom in the ball valve, forming a clear passage for the water which flows through the aperture into the plug, and, passing upwards, is stopped by the screw-down valve immediately above, by means of which water is drawn in the

usual manner. This valve has a raised seating formed in the body of the tap, and has no contact with the plug. When it is desired to examine or repair the valve it is only necessary to give the hollow plug already described half a

turn, thus shutting the water off from contact with the valve and working parts, which can then be taken out and replaced at leisure without trouble or waste. The patent duplex valves and taps are made in all the ordinary ball, bib, and main forms, and the principle may be applied to any special description of valve by arrangement with the patentee. The valves and taps have been fitted in private houses, institutions, and other places, and have given great satisfaction. They are capable of being repaired at any moment without interfering with the general supply. Water companies will consult both their customers' and their own interests by requiring the use of these valves. For lavatories and other departments fitted with several taps, great economy can be effected

by adjusting the hollow plug so as to allow only a moderate flow, no matter how high the valve is lifted. For steam purposes the duplex valves are most valuable. Not only can any particular valve be examined or repaired at any moment, but steam valves commanding branch pipes can be closed, the valve removed, a cap screwed on, and the steam turned on again without the valve itself being necessarily replaced, should it be inconvenient to do so on account of stopping various operations. The valve can be ground in or otherwise repaired at the close of the day's work, or at any suitable time.

They are most useful for private houses, as the ball valve can be repaired and made equal to new while the service branch from the main is charged with water.

For hot-water service the patent duplex bib valves are invaluable. With the hot-water taps at present in general use, before the most trifling repair can be effected the fire must be let out, cooking suspended, and many domestic arrangements upset, causing general inconvenience.

Considering its intrinsic value, and the large number of purposes to which the new inven-

### UNHEALTHY AREAS, NOTTINGHAM.

THE Nottingham Town Council have adopted the report of the Health Committee on the condemned area in Parliament Street. In the report the Committee state that they have continued their negotiations with the owners of the properties in the condemned area, upon the terms mentioned in the report to the Council, dated the 5th day of April, 1882, namely, that the price to be paid for the properties should be the same as that on an ordinary sale from a vendor to the Corporation, with 10 per cent. in addition for compulsory purchase. The whole of the owners, with the exception of three, entered into agreements with the Corporation that the prices should be fixed by Mr. Robert Evans (Evans & Jolley, architects and surveyors, Nottingham) on behalf of both parties. Mr. Evans sat for several days in October and November last at the Exchange, and heard the claims of the various owners and the evidence on behalf of the owners and the Corporation as to the values of the properties. The Town Clerk conducted the cases for the Committee, and the leading architects and surveyors of the town were called on behalf of the Corporation. The cases were on behalf of the owners conducted by their respective solicitors, who also called professional witnesses in support of the claims. Mr. Evans published his awards on the 30th and 31st days of March last, with the names of the owners and lessees, together with the amounts awarded, set out in schedule. These awards amount to a total sum of 141,341*l.* Of this sum 13,460*l.* is awarded in respect of trade compensation to several owners who carried on business on the properties belonging to them. After deducting this from the total amount there remains 127,881*l.* as the awarded values of the properties dealt with by Mr. Evans. The total claims for these properties amounted to 178,039*l.*, and the values put on the properties

by the professional witnesses for the Corporation amounted to 105,130*l.* The amounts awarded were 22,751*l.* in excess of such last-mentioned values, and 50,158*l.* below the owners' claims. The claims for trade compensation amounted to 20,785*l.*, and the awards, as before stated, to 13,460*l.* No valuations in these matters were made in behalf of the Corporation. It seems, therefore, that the Corporation have no reason to be dissatisfied with the arbitrator's awards, and that he has acted fairly between both parties. With regard to the claims of the three owners who declined to enter into the agreement to refer to Mr. Evans, an arbitrator (Mr. B. B. Hunter Rodwell, Q.C.) has been appointed by the Local Government Board in accordance with the Artisans' and Labourers' Dwellings Acts. The Committee recommend the Council to confirm their proceedings, and to direct the Finance Committee to raise the necessary sums of money required to complete the acquisition of the area included in the scheme, by mortgage, loan, or otherwise, as they may think most expedient.

### OLD CHESHIRE CHEESE INN, WALLASEY.

THE village of Wallasey in "Doomsday" is called "Walea" in a charter of 1081, and was afterwards changed to Walayesigh. After 1487 it is written Wallesey and Wallsea.

"Ormrod's History of Chester" states that "in the reign of Elizabeth, Wallasey had a little port, to which there belonged three barks and fourteen men, a very inconsiderable quantity, but nevertheless nearly one-fourth of the number of barks and mariners which then were employed at the infant port of Liverpool on the opposite shore, as in the same year, 1565, a census extant in the town records states the entire number to consist of only twelve barks navigated by seventy-five sailors." The Old Cheshire Cheese Inn is a quaint, squat, long, one-storey building, thatched, divided into two rooms, with a cock-loft over the kitchen. It is

stated that King Charles II. slept in this old bed-chamber. The gable of the kitchen is built with freestone in regular coursed work, having an angle fireplace and a two-light mullion window, now built up with a modern window at one side. The entertaining-room has a large hooded chimney corner used in the days of log fires, with two old-fashioned squat seats. The roof is framed with arched jaw principals in oak, the feet rest upon the floor for support, and the rafters are tied across here and there. The beer-cellar is opposite the entrance, which is direct into the room. Here is a very pretty Queen Anne door and casings in panels and lattice-work, and a cupboard of the same date is fixed in the chimney corner.

The road into the village at this point being narrow, the Commissioners have purchased the land upon which the inn now stands from the proprietor of the Vale Brewery, for the purpose of making the road wider, which will be a great improvement, and in a few weeks this ancient hostelry will be cleared away. The license dates back 220 years.

Mortimer's "History of the Hundred of Wirral" says:—"In 1690 the troops of William III. were encamped in the village and neighbourhood, previously to their embarkation for Ireland in the year 1696, accompanied by his Majesty in person and a brilliant staff, including the Duke of Monmouth, the Marquis of Ormonde, the Earls of Manchester, Oxford, Portland, and Scarborough, and many others. The host of the Cheshire Cheese takes pleasure in showing the kitchen, which is traditionally reported to have been selected for the royal dormitory.

"The Wallasey Leasowe was probably the oldest gentlemen's racecourse in the kingdom, being noticed by Webb as existing in the early part of the seventeenth century. In 1683 the Duke of Monmouth rode as jockey a race which he won, and presented the plate to the daughter of the Mayor of Chester. Races discontinued 1750."

"Wallasey was once an island, its original name being Kirkby-in-Walley, meaning the church in the woody island: the parish being separated

## THE SOFTENING AND PURIFICATION OF WATER.

AWARDED GOLD AND SILVER MEDALS AT THE INTERNATIONAL HEALTH EXHIBITION.

The PORTER-CLARK PROCESS is largely employed in County Asylums, Hospitals, Schools, and private Mansions, and is adopted upon a much larger scale in many Industries. By this process the Lime and Magnesia are removed from the water, together with organic impurities and the calcareous deposits in pipes and boilers.

**JOHN HENDERSON PORTER,** Patentee, 1 & 2 Tudor Street, London, E.C., furnishes the necessary Plant.

from the rest of the hundred by a small brook called the Birkin. Tree-stumps and peat are still to be seen, the remains of a dense forest towards the sea." (Hume.)

A new hostelry is now being built in the garden belonging to the old inn in the Queen Anne style. The old wood and other fittings will be refixed here, and the old oak timbers made into furniture, so that any architectural features the old house may be considered to possess will be preserved. The new building has been designed by Mr. T. C. Ebdy, architect, of Hamilton Street, Birkenhead, the contractors being Messrs. W. & J. Varty, of New Brighton.

### BUILDING BY-LAWS IN BEDFORD.

At the last meeting of the Rural Sanitary Authority, a deputation of local architects and builders handed in a list of amendments to the building by-laws. The deputation comprised Messrs. Usher, John Day, Young, Mercer, Anthony, architects; and Messrs. G. Haynes, Richards, Foster, Warton and Leighton, builders.

Mr. Usher said he appeared with the deputation of architects and builders of the town, and stated that they had been looking over the by-laws with great care, had spent a considerable time over them, and brought a considerable amount of judgment to bear on them; and they found them very oppressive and deterrent to the building interests of the town of Bedford. He would say they did not attend there to represent the jerry-building and scamping trade in any way whatever: the town should have good sound laws, and he could say for himself, and on behalf of his colleagues there that day, that they found the officers of the Authority—Mr. Lund, Mr. Hull, and Mr. Meek—were very expert, and looked well after the interests of the town; but they must carry out the laws the Authority put into their hands, and those laws they (the deputation) found to be very oppressive. He thought every member of the Authority had received a copy of their recommendations, and they hoped they would

take them into consideration and act decisively, and early too. He said early because there were some thousands of pounds lying idle in the town, and building was quiet and at rest in consequence of the oppressive character of those laws; therefore it was of great importance that no time should be lost in the amendment of them. He made a little calculation, and found that there were really many thousands of pounds lying idle because the builders could not proceed under those laws. That related specially to houses from 30% to 45% a year, in which the party walls were now required to be of greater thickness than in the metropolitan districts of London. It also affected the artisan class in the town very much. There was no restraint as yet in the application for houses; there was in fact a great demand for houses from 40% to 60% a year continually flowing in. They asked that no time should be lost in amending those laws, and that the Authority would empower their surveyor and inspectors to fall back on the old by-laws whilst the amendments were taken into consideration. If they would give them their careful consideration, it would be for the interest, not only of the building trade, but of the borough itself.

The Mayor (Mr. Hawkings) said he could not say what the Authority would do, but he was sure they would do the best they could. He thought the whole of the proposed amendments they had made should be put into the hands of a committee, which should be empowered to call to its assistance any number of builders or architects to assist them in the consideration of the amendments. Speaking on behalf of the Authority, he was exceedingly obliged to the deputation for the great interest they had taken in the matter, and for the respectful manner in which they had come before the Council to express their views. Their work was so important that they could only wish, as an Authority, to court the confidence of every section of the community. They felt that it was important to have that confidence if the work of the Authority was to be carried out satisfactorily; without it, it was impossible to adjust the interest of every class so that none

of them should clash and irritate the other. Coming to the builders, they felt they were so important to the interests of the town, and the welfare of the borough depended so much on the attitude of the builders, that they would go out of their way to consider them, and would pay the utmost deference to their views; and particularly to the architects and men like Mr. Usher, who was always prepared to go out of his way to advise them wisely and well. His Worship then gave a short history of the by-laws, and said three years ago it was felt that some alteration was required. The matter was put into the hands of a committee, which comprised two medical men, a large builder, and a retired architect; it had besides the assistance of their surveyor, and therefore it was only right to say that they would be unlikely to be rash or unjust. The committee went to work very carefully and adopted as their basis the model by-laws of the Local Government Board. When the by-laws came to the Authority from such a committee, and under such auspices, they did not go into such minute details of them as they otherwise might have done. But by public advertisement it was said that they were prepared, and a draft ready to be submitted to the Local Government Board, but before being so submitted it was open for the architects' and builders' criticism and for the public generally. The Authority asked for it and he only regretted that the interest they had in the town did not lead them then to inspect those by-laws. They did not do that, and consequently the Authority came to the conclusion that they were in favour of them. He laid no particular stress upon the constitution of that committee, nor were they more responsible than the other members of the Council; they were all jointly and equally responsible. Personally his one desire was to secure two things—firstly, good drainage; secondly, good materials. With regard to the thickness of the walls, he felt that was a matter which could be very much in the hands of the builders, but in the interests of the whole town he wished to secure good drainage and good materials.

## ASBESTOS PAINTS.

ASBESTOS PATENT FIREPROOF PAINT. All wooden buildings or erections should be painted inside and outside with this paint, as a means of protection from fire. All the wooden erections in the INTERNATIONAL FISHERIES AND HEALTH EXHIBITIONS were coated inside and outside with this paint by order of the Committee of Directors. ASBESTOS OIL PAINTS, non-corrosive and very durable; suitable for Gasworks, Bridges, Roofing, Wharves, Waggon, &c., &c.

## FIREPROOF PAINT.

Sir FREDERICK BRAMWELL, C.E., F.R.S., Chairman of the Executive Council of the International Inventions' Exhibition, 1885, in referring to the preservation from fire of inflammable building materials, made the following remarks in his Presidential Address at the Institution of Civil Engineers, on January 13th, 1885:—

"The processes, more or less successful, that have been tried are so numerous that I cannot even pretend to enumerate them. I will, however, just mention one, the Asbestos Paint, because it is used to coat the wooden structures of the Inventions' Exhibition. To the employment of this, I think, it is not too much to say those buildings owed their escape, in last year's very dry summer, from being consumed by a fire that broke out in an exhibitor's stand, destroying every object on that stand, but happily not setting the painted woodwork on fire, although it was charred below the surface. I do not pretend to say that surface application can enable wood to resist the effects of a continued exposure to fire, but it does appear that it can prevent its ready ignition."

# The Architect.

## THE WEEK.

THE awards of the "Prix du Salon" and the travelling bursaries were determined on Saturday last. This year a sculptor, M. HORACE DAILLON, gains the coveted prize. His principal work is the *Awakening of Adam*. Next to him came M. FRITEL, the painter, whose *Solum Patrie* was deserving of a high reward. The bursaries for travelling have been awarded as follows:—Architecture: MM. QUATESOUS and DEPASSE. Painting: MM. MANGIN, FRITEL, HAMMAN, LAURENT, and MARTIN. Sculpture: MM. PECH and G. LEROUX.

A REFORM BILL for the Royal Academy, drafted by "An Outsider," has been published in the pages of a contemporary. Everybody, says the writer, knows that those works which fulfil the conditions set down in the rules as to frames and so forth are passed in rapid succession before the selecting committee, and are marked "A," "D," or crossed, according as they are "accepted," placed on one side as "doubtful," or "rejected" altogether. Now, it will probably astonish the public very considerably to learn that the committee really comes to no decision, practically speaking, inasmuch as that for many years past not more than 175 pictures out of the thousands sent in have even been accepted outright. The cause of the phenomenon is simply expediency. For in times gone by a goodly number of pictures used to be accepted unconditionally, if they merited acceptance; but as it often happened that in the process of hanging a "doubtful" picture, taken at random, secured a place on the walls just because it fitted in well, and "accepted" pictures were afterwards found to have been thereby crowded out, it was determined to silence the clamour which this incongruity gave rise to by the simple method of reducing the "A's" to a minimum and leaving the bulk of the pictures "D's"; so that if a painter had his picture returned unhung, he had no special cause for complaint. The limitation of the number of works sent in by outsiders to two, and by Academicians to four, is a remedy suggested whereby this state of things may be ameliorated, the number of works sent in be reduced, the work of the selecting committee lightened, and the quality of the exhibition improved.

IN reviewing the second volume of "The Life of Raphael," by Messrs. CROWE and CAVALCASELLE, we suggested the importance of illustrating the process by which the painter designed his pictures, which was, speaking generally, to take the most eligible bits out of other pictures and to make a new combination of them. We have since had an opportunity of examining the immense mass of materials which Mr. CROWE has been collecting during the last twenty-five years for his work. He has copied or had photographs taken of many of RAPHAEL's pictures, and of all the drawings relating to them which can be discovered in the public and private collections of Europe. They are arranged systematically, and in consequence the process of compilation becomes plain to every observer. It has been said that GRAY's "Elegy in a Country Churchyard" resembles a mosaic, as all the fine phrases have been derived from other writers. RAPHAEL's works are of a similar class: they are "elegant extracts," and the difficulty is henceforth to prove his originality. The reproduction of the evidence could not be undertaken unless at the public cost. But would it not be possible for the Royal Academy or the Royal Institution to tempt Mr. CROWE to exhibit his collection, and to give an explanatory lecture on the most extraordinary revelation that has ever occurred in respect to a famous artist?

THE annual report on the proceedings of the Public Record Office during 1883 has just been published. Amongst the mass of information given is an account of the progress made during the year in making facsimiles of national manuscripts and other documents by the process of photozincography, and with the calendars. The volumes of calendars published in 1883 were the seventh volume of

the Calendar of Letters and Papers, foreign and domestic, of the reign of HENRY VIII., for the year 1534; the tenth volume of the Calendar of Domestic State Papers during the Commonwealth, the fifth volume of the Calendar of Treasury Papers, and the second part of the fourth volume of the Calendar of Letters, Despatches, and State Papers relating to the negotiations between England and Spain, including the years 1531-3. Six additional volumes of the series of Chronicles and Memorials of Great Britain and Ireland during the Middle Ages were published during the year. The researches made in foreign documents and the investigation of the Canadian archives are also referred to, as well as the amount of business done in the Search Office, and other matters.

THE new hospital at Havre was opened on Sunday last. It was designed by M. LÉON DAVID, who was placed first in the competition. The cost has been 1,875,000 francs, or over 6,000 francs per bed. There are seventeen pavilions, running east and west, with the principal façade to the south. Each is completely isolated, and largely exposed to the sun's rays.

WRITING from Stratford-on-Avon, Mr. ARTHUR HODGSON, the mayor of that town, makes an earnest appeal to the English nation and "our American cousins" for funds for the restoration of the church in which SHAKESPEARE is buried. The total sum required, he says, is, according to the estimate of the architects, Messrs. BODLEY & GARNER, 12,000*l*. "There is no intention to beautify, remodel, pull down, or reconstruct, but to repair and maintain our noble parish church, which was dedicated six hundred years ago to the glory of God, and is the sepulchre of one of the greatest men that ever lived. The memory of WILLIAM SHAKESPEARE is closely bound up with Stratford and Stratford Church, and extends to the whole civilised world. The sum of 12,000*l*. is large. Warwickshire has been severely hit by agricultural depression, and, unfortunately, the three largest churches in the county—St. Michael's, Coventry, St. Mary's, Warwick, and the Holy Trinity, Stratford-on-Avon—are simultaneously making appeals for a Church Restoration Fund. It may be a misfortune, but it is a necessity, the gnawing tooth of time having left its unsightly marks upon these noble churches, and no time is to be lost to prevent their falling into decay."

THE Birmingham School Board have been trying to obtain compulsory powers for the acquisition of a piece of land belonging to the London and North-Western Railway Company, for the purposes of a site for a new Board school. A Select Committee of the House of Lords on Monday, however, refused to confirm the order, as they did not consider the School Board had made out its case. Of course evidence was given on the part of the School Board to show that the proposed site was the most desirable of all sites, and that for one reason or another no other sites were so available, &c., or as Mr. MICHAEL, Q.C., for the School Board put it, it was absolutely necessary that they should have that site, there being no other land available. The School Board inspector, perhaps, was inclined to be facetious when, in cross-examination, he added that he considered that "near the gasworks was a good place for a school, especially if the whooping-cough was about." It seems, however, that the Board will have to forego this most desirable site for their proposed school, and no doubt they will be rewarded in the long run by finding some other site which will be a good place for a school, more particularly when measles are about.

AN account has been furnished by M. MASPERO, the conservator of the Museum of Boolak, of recent discoveries made at Akhmim, on the banks of the Nile. Having noticed in villages of the neighbourhood that the water-troughs in front of the houses consisted of sarcophagi, cut out in part like the human form, his inquiries elicited from the peasants that, when in need of a new drinking fountain for their cattle, they went to the mountain and brought back as many as they required. M. MASPERO now says he has explored the hill over an extent of at least two miles in length, and everywhere found it intersected with pits and chambers.

## THE CONFERENCE OF FRENCH ARCHITECTS.—II.

THE principal attraction for the third day of the Congress (Wednesday) was the description of "le premier temple de Jérusalem," which was to be given by M. PERROT, the director of the Ecole Normale Supérieure, and M. CHIPIEZ, the architect. The names of these gentlemen are not unknown in England, for translations of the volumes of their "Universal History of Art" are published in London almost simultaneously with the appearance of the originals in Paris. Literary partnership is more common in France than in England, and its advantages are exhibited in that work. M. PERROT holds a high rank among *savants*; but he recognised the fact that, as art of every kind was formerly connected with architecture, it was necessary, if his history were to be trustworthy, that he should secure the co-operation of an architect, and, having been attracted by an essay of M. CHIPIEZ, he sought out that gentleman, and at once arranged a partnership with him. The restorations which M. CHIPIEZ has made of Assyrian and other temples are based on literary as well as archæological evidence. They are always consistent in their parts, and it is difficult to point out a feature that is misplaced. But the majority of people cannot accept experiments of the kind without hesitation. The most ample newspaper description of a modern building is insufficient to enable us to make a sketch that would resemble the work, and the old writers certainly thought more of effect and less of detail. In the case of the well-known description given by PLINY of his villa, where there appears at first sight to be the most minute detail, a perfect realisation is still an impossibility, as we can see by the differences between the schemes of restorers. It is not, therefore, surprising that, while everyone was charmed who heard the explanations of MM. PERROT and CHIPIEZ, and saw the projections on the screen at the Ecole des Beaux-Arts, yet if a vote could be taken few of the architects would be found ready to believe that the question had been settled once and for ever.

The object of the authors was to demonstrate the architectural importance of the words of EZÉCHIEL, and they maintained that, although the description was given as a vision, yet, if taken in connection with what is found in the Books of the Kings, the Chronicles, and Josephus, it will enable us to realise the *ensemble* of the edifices on the Moriah, the Temple and its dependencies, just as they existed when the city was captured by NABUCHODONOSOR. MM. PERROT and CHIPIEZ do not claim that all the parts of the *ensemble* indicated by the prophet have been achieved by them in their restoration, but they say that the vision is sufficient to allow of a plan being drawn which would serve for the reconstruction of the Temple hereafter. M. CHIPIEZ, having studied the vision from an architect's point of view, has come to the conclusion that it is not to be classed with the description of the heavenly Jerusalem in the Apocalypse, but that the figures in the Hebrew text suggest a *modulus* which was generally employed, and by the use of which a coherent plan can be obtained. There may have been documentary evidence as well as traditions among the Levites, which would illustrate at least the principal sides of the Temple, and, if so, they must have been known to the prophet. Whatever may be the value of his vision, MM. PERROT and CHIPIEZ do not believe for a moment that it is a poetic romance, and in this sceptical age that is an important concession.

Among the corresponding members of the Institute of Architects we doubt if there be one who is so zealous for its interests or so desirous to serve his *confrères* as M. CHARLES LUCAS. If he were a consular agent for Great Britain in Paris, he could not be more ready to accede to applications for his aid. The subject of his paper offered a strange contrast to what came before it, and suggested how manifold and widely separated are the matters in which an architect must take concern. M. LUCAS gave a "Compte rendu du Congrès des Sociétés savantes," and in so doing brought his auditory from the Holy Place in Jerusalem back to Paris and the Quartier Latin. For eight centuries at least the environs of the Hill of Ste. Geneviève have been supposed to be the place of all others where a welcome was offered to everyone who sought knowledge or could impart it. But even there exclusiveness prevails, and within the Sorbonne, of which

the name is almost synonymous with freedom, a number of societies are allowed to meet in the building and form a sort of imitation of the Institut. The speakers, who "take all knowledge for their province," are not afraid to grapple with the difficult problems of architecture, whether considered as an art, or as an element in sociology. Thus, for example, in April they discussed the most economical means of constructing workmen's houses, and the partition of house property. But there is no recognition of the Société Centrale in the discussions. Architects and builders may be condemned without a word being heard on their behalf. In France an importance is given to meetings of the kind which cannot be appreciated in England, and accordingly M. LUCAS and other energetic members of the Société have been endeavouring to gain a footing in the Congresses at the Sorbonne. Their persistence has been so far successful that the Minister has decreed that at the next Congress the questions of "Round Churches still existing in France," and "How far Architecture can be made a part of General Education" are to form parts of the programme. It so happens that M. LUCAS has treated of the former subject in the course of an essay on the English Round Churches at Northampton, Little Maplestead, and the Temple Church. M. LUCAS was applauded, as he well deserved.

As we stated last week, Thursday was assigned to a visit to Rouen. But a journey of 250 miles going and coming is not inviting on a broiling day and in a slow train. It is not amazing that so many members declined to take part in the excursion, on the ground that they knew every old stone in the city. Friday was an essentially business day with the Congress. There are always standing committees who have to consider questions relating to competition, education, municipal regulations of building, and the like. The reports have to be often considered before they appear in print and receive the seal of the Society. The members on Friday had an opportunity given to them to hear what was being done. On the same day M. CÉSAR DALY was good enough to speak on education in his most polished style.

But the great day of the Congress was the last. It was known that on Saturday the rewards of the Société were to be delivered, and what more could be needed to fill the semicircular hall? In England a distribution of prizes suggests a meeting of an art school, a long and generally a prosy address by the local member, in which the leading ideas are the achievements of the late Prince Consort and the necessity of holding our position in the markets against foreign competition.—It is not surprising that when another attraction is offered, as happened a few months ago at South Kensington, the orator finds nobody in front of him except the reporters and the youths who want their medals and are impatient to escape elsewhere. In Paris it is different. There the giving and receiving of rewards in public is an institution, and every man of merit takes his part in it a great many times in the course of his life. Virtue is not supposed to be its own reward in France, as it is with us. There are Monthyon prizes in hard cash for the lucky exemplars, and medals and crosses in various metals for others. The Société Centrale of Architects could not hold its position if it did not undertake to assess the respective values of architects, contractors, foremen, and apprentices. A constant competition is going on, and the humblest workman may expect that one day his fidelity to his master is to have its reward, and that for a few moments the applause of a crowd will make his ears vibrate. It is not, therefore, surprising that on Saturday men and women of all classes and of all ages were to be found in the hall, and that enthusiasm prevailed throughout.

It is customary on those occasions to invite some distinguished man to preside, and on Saturday the choice fell on M. ALPHAND. Need we say that in an assembly of the architects, contractors, and building workmen of Paris M. ALPHAND is recognised as the greatest man in the city? If the offices which are so efficiently held by Sir J. W. BAZALGETTE, Mr. VULLIAMY, and Colonel HAYWOOD in London could be combined, they would be far from corresponding with that of the "Directeur des Travaux de Paris." What is done in London by government bodies and public companies is as much under the control of M. ALPHAND as work like that of the engineering and architectural departments of the Corporation and the Metropolitan Board of

Works. M. ALPHAND is also responsible for the supply of water to the city, for the condition of the Seine, for the survey of Paris, for the decoration of the public places, for upholding the amenity of the most beautiful of capitals. He has one department where constant observations are being made by a staff of chemists and meteorologists on the air and water of Paris, and where the movements of bacteria are watched as closely as those of the criminal classes by the Préfecture de Police, and in another department folio volumes are being prepared on the history and topography of old Paris, and the most interesting documents are reproduced. How one man can get through so much business, and such a variety, is a mystery, until an opportunity is given to observe him closely. It then becomes evident that M. ALPHAND has that power of despatch in which BACON took delight as a theoretical moralist. When M. ALPHAND has work to do he does it with all his might, and with his attention rivetted on what is before him. On Saturday he appeared to be the ideal of a chairman for such an occasion. It might have been an everyday occupation. His duty on handing a medal seemed to be as much a pleasure to him as to the recipient. He had something friendly to say to every prize-winner, and grasped the humblest workman's hand with as much vigour as if he had been an old acquaintance. But the men knew well how rigorous the chairman could be if there were departures from equity in contracts, and it may have been a fear of a sudden revelation of their little peccadilloes in municipal works, which made so many of them nervous when their turn came to meet the flashing eyes, and so maladroit afterwards, when exhibiting the medals to their relatives and friends. The chairman never forgot business in his eloquence, and marked off every recipient's name on the programme with as much care as if he had been paying for large contracts.

M. ALPHAND's address was remarkable. He said frankly that he was an engineer who had been occupied all his life with works, and he was not competent to discourse upon abstract questions relating to art. But he proudly referred to his own career as evidence of his appreciation of architects, and of his earnest desire to secure their co-operation. It was impossible, he believed, for any one man to combine the scientific skill and the artistic ability which were needed if public works were to be made worthy of their country, and he insisted on the necessity of the architect; no less than the engineer, being represented in civic constructions. It was the adoption of that principle which made Paris what it is now, and in other countries, where an attempt was made to fuse the two professions, the result was never satisfactory. The superiority of French architects was seen in the Hôtel de Ville, the Palais de Justice, the Opéra House, and other buildings. The books of VIOLETTÉ-LE-DUC suggested what they were as archæologists. The French engineers could likewise point to their own trophies. It was better for them all to respect their traditions and adhere to that division of labour of which they knew the value. But the engineer should summon the architect to give beauty and harmony of contour to his construction, and the architect should not hesitate to have recourse to the engineer whenever scientific principles had to be applied. M. ALPHAND said that it was an honour to him to have his name associated with those of so many famous architects in beautifying Paris. With their support he had been enabled to ameliorate regulations which, if enforced literally, would have made the houses as dreary as so many barracks or factories, and architects knew that in his department the law was interpreted in a broad and liberal spirit. Then, glancing at the economic side of the subject, M. ALPHAND said there never was a time in which it was more incumbent on the two professions to be united, and, hand in hand, to take their place as the rightful directors of labour. There were erroneous notions abroad. The workmen were co-operating, but in doing so they ignored how much was owing to skilful planning and direction, and to capital. All the gains were supposed to belong to the operatives, and none to the artist or the capitalist. But M. ALPHAND recognised the advantages of co-operation, which he said merited their encouragement, and it was their duty to foster the just aspirations of their fellow-men. They should all bear their share to help their country until the time came when France

would arise more glorious than ever, and assume the position that belonged to a nation which had shed the blessings of liberty and civilisation over the world. An address of this kind, in which every word bore the mark of sincerity, was received rapturously, and perhaps some may have thought how different must have been the fate of their country if in 1870 the army had been administered by their chairman instead of by a luxurious man named LEBŒUF.

Mr. L'ANSON attended the meeting as the representative of the Royal Institute, and read a short address in French in a manner which surprised Frenchmen, as they could detect no trace of that insular pronunciation which they have so often to endure. Mr. L'ANSON expressed the great interest which English architects take in the Société, and condoled with the members on the loss sustained by the deaths of two eminent members. M. ABADIE's restorations at Angoulême, Périgueux, and Bordeaux were known, he said, to English travellers, as well as his work at Montmartre. They also admired the churches and Hôtel de Ville designed by M. BALLU. Mr. L'ANSON exhibited the diplomas for M. ANDRE and M. HERMANT with which he had been entrusted, and his references to the good feeling which was held towards French art in England were loudly applauded.

A biographical notice of M. ABADIE was read by M. DAUMET. It showed that truth is stranger than fiction, as in his infancy ABADIE was tended by wilder fellows than the miners in Mr. BRET HARTE's story of "The Luck of Roaring Camp." His nurse ran away during the invasion of 1812, and he was picked up by a band of Cossacks, who looked after him until he was discovered. His father was also an architect, and having been appointed departmental architect of Charente in 1818, the family removed there. Young ABADIE returned to Paris in 1830, and entered the Ecole des Beaux-Arts. He tried for the Prix de Rome in 1839, but failed against LEFUEL. He was attached to the works of the Hôtel des Archives, and afterwards held a position under the Council of Civil Buildings. On the same day two inspectorships were offered to him. One was at Notre Dame under LASSUS, with VIOLETTÉ-LE-DUC for a companion, the other was at the Chamber of Deputies. He made his selection by hazard, and accepted the former post, his rival, LEFUEL, taking the other. Afterwards he was appointed to the Commission of Historic Monuments, and diocesan architect for Angoulême when his father had gained a reputation. In his activity he resembled many French architects. He became Inspector-General of Religious Edifices, and his reports are valuable as archæological essays. At the last Congress he conducted the members over the works of his great church at Montmartre with the greatest delight, and looked forward to its completion with confidence. But two months afterwards the brave architect succumbed to a sudden attack.

The report of the Commission who awarded the prizes for "Architecture privée" was read by M. SÉDILLE. The first medal was awarded to M. ESCALIER. It may be difficult to combine the duties of an engineer and an architect, as M. ALPHAND pointed out, but M. ESCALIER has shown that a man can gain renown as a painter without ceasing to be a thoroughly practical architect. Last year he obtained one of the principal medals of the Salon for an immense decorative picture, and the companion work exhibited this year is no less remarkable. Another medal was awarded to M. HERMANT, who had been seated near the chairman. This gentleman is one of the new corresponding members of the Royal Institute. A third medal was gained by M. MARTENOT, of Rennes, and diplomas for jurisprudence and archæology by MM. LUCIEN ETIENNE and R. P. CROIX. All the recipients are men of standing in the profession, and were as proud as young students of their success.

An elaborate report on the remaining eight classes had been prepared by M. PAUL WALLON, and was read by him. It will suggest the position held by the Société, when we say that there were competitions for the rewards among the French schools of Athens and Rome, the Ecole Nationale des Beaux-Arts, the Ecole Nationale des Arts Décoratifs, and Ecoles Privées. M. LALOUX, of the Roman school, who is the fortunate winner of the great prize of the Salon this year, obtained one of the medals. In art industry, M. GUILBERT-MARTIN was the prizeman. He is a chemist,

and has taken up mosaic work with great success. Then came the rewards to apprentices, to stone-cutters, to contractors, and to workmen. In the section of "Personnel du Bâtiment" there were eighteen medals, and, indeed, as M. WALLON said, the Société in its action resembled what took place daily, and it became more generous as it became poorer. Some of the men had spent nearly forty years with the same firm, and those long services are among the phenomena of French life. M. WALLON is sympathetic, and he narrated the biography of the individual prizemen with evident interest. He is proud of his office, and it is evident that the members are no less proud of him and of the sacrifices which he makes to insure the success of the Society.

The business of the meeting was closed with a brief address by M. QUESTEL, to whose credit it must be said that throughout the proceedings he endeavoured to gain applause for everybody but himself. His action as President was no less marked by modesty than by dignity.

In the evening there was the annual *dîner confraternel* in the Hôtel Continental. M. QUESTEL presided, and opposite him sat Mr. I'ANSON, with M. ALPHAND and M. GARNIER. Mr. I'ANSON spoke happily. On those occasions it is always a treat to hear M. GARNIER'S humour, but his good things cannot well be repeated; for, as he said once, "C'est le ton qui fait la chanson." And thus in the best of spirits the members who took part in the Congress separated.

## NOTES ON SOME PROVINCIAL CHURCHES.

[BY A CORRESPONDENT.]

THERE are many peculiarities in Cornish churches which have been commented on by other writers, so I must content myself with but a slight summary of them, viz., the nave and chancel all under one continuous roof; the span-roofed aisles nearly as wide and as long as the nave; the plan comprising sometimes a nave and south aisle and one arm of the transept; the chancel screens, which extend or have extended over the whole width of church, as shown by the upper and lower doorways in the aisle walls; the characteristic roof with principals, having collar beams and braces. In the neighbouring county of Somerset I also remember two such examples of screens, at Long Ashton and Keynsham Churches. The frequent occurrence of wayside crosses of simple design, one very much like another, is one of those pleasing features that must strike the traveller in Cornwall; they are said to have been erected wherever a corpse was rested. The stone lich-gates, a sensible material to employ in a county where timber was scarce and stone or granite abundant, are also noteworthy. I call to mind a good example at St. Levan, near the Land's End, where there are two lich-gates, though the church is a small one, looking almost buried in the side of a hill at the chancel end, a curious site to have chosen, but one, I believe, not uncommonly selected in Cornwall. In the centre of the gateway is a block about 20 inches high, shaped like a coffin, on which the corpse was rested, and on each side a granite seat, with ends and backs to it about the same length as the central block. Speaking of the church roofs, in several instances the space between the ashlar pieces of the nave and aisle span roof is left quite open, with good effect. The elegant spire of Lostwithiel Church is well known by illustration, so I will only remark how very effective is the double plane of tracery to the spire lights, causing such depth of shadow. In the same church the arrangement of the piers to the nave arcade (the only one I know of Early English date, though there may be other examples) has two chamfered orders dying on the piers without any abacus or string. This is more characteristic of Flamboyant than thirteenth-century work.

In some of the handsome old bench-ends in Cornwall the emblems of the Passion are represented, appropriate enough decoratively when on a small scale, but not so when the dimensions are large, owing to the undecorative character of some of them—the lantern, hammer, &c., for instance. At Launceston Church, and also at the parish church at Truro (now pulled down and incorporated with the new cathedral), there was an extraordinary amount of carving in the granite, every stone in some parts with scarcely an atom

of plain surface. It can scarcely be called a diaper, for though the same pattern is often repeated, yet there are considerable minor variations in the design. The richness here is the more remarkable, because generally in Cornwall very little work was applied to so hard a material as granite. The porch to the interesting church at St. Neot's, in this county, has a barrel vault of unusual design, having remarkably massive ribs with diagonal ribs also.

In Northamptonshire, though there are some very choice examples of Early English work, there are also several specimens, as at Higham Ferrers, Irthlingborough, and Warmington, of that very ungraceful type of thirteenth-century window verging on the Decorated, when incipient tracery was budding, the heads of the lights straggling up into what ought to be the domain of the tracery. At Rushden Church, in the same county, the arches of the Perpendicular windows "are four-centred, but yet in some instances acutely pointed, and the windows themselves of considerable height, the upper segments being not distinguishable from straight lines. The tracery begins considerably below the spring of the arch, and is often divided into stages by transoms, sometimes embattled, or by uniting two lights under one arch, so as to form a row of quatrefoils. Though these windows are constructed on a principle contrary to the commonly received ideas of beauty, it cannot be denied that the general effect of them is rich in the extreme." ("Churches of the Archdeaconry of Northampton," p. 178.) I may remark in reference to this that in foreign examples, as at Beauvais and elsewhere, the tracery of the window-head is brought below the springing line. Our usual English treatment of commencing it at the arch springing line seems more elegant and sensible. It is true that by the other a larger area for tracery is obtained, but to the detriment of the remainder of the window. The detached campanile to Irthlingborough Church, octagonal in plan in its upper storeys, is a very striking object. One regrets to hear that it is, or was, in a dangerous state.

At Westbury Church, Wiltshire, a building principally of the Perpendicular period, is a remarkable and almost unique treatment, in England, of the nave aisles—i.e., a transverse arch springing from each nave pier on to the aisle wall at the same level as the abacus of the nave capitals. In order to make this arch as wide as possible, the mouldings interpenetrate those of the nave arcade, as in Flamboyant work. The outer order is continued above the nave side, upwards in half of the arch, in an ogee form. The vista of one cross arch after the other in long perspective is very good, but the roof of each bay in the lean-to aisles is but a poor one, with plain ribs. These transverse arches seem to demand a nobler treatment to the roof. One would like to see a kind of domical stone vault to each bay, in the style of that to the aisles of Bristol Cathedral, but of course simpler.

The fine parish church of Ryde rather lacks height. I understand that, in the original design, the late Sir GILBERT SCOTT intended it to have been of more lofty dimensions; but, in order to save money, the height was cut down. One cannot but think that another way of reducing the cost might have been found by placing two-light windows to the aisles, instead of the elaborate three-light windows, which seem too pretentious for a parish church. The pulpit is a beautiful one, in which different kinds of marble and alabaster are employed. The introduction of two saints in each of the square-headed panels—St. STEPHEN and St. ALBAN among others—is a change from the four Evangelists so usually decorating such positions. It is right that the lesser lights of ecclesiastical history should have their turn in our church sculptures. The organ-case, when I saw it, had spotted metal pipes, without any bands or woodwork in front of them, and looked, to my mind, quite as well as if it had a quantity of *appliqué* woodwork. It has a handsome oak "impost," evidently designed by the architect of the church. The chancel is well decorated in colour by Messrs. CLAYTON & BELL. But the oak credence and sedilia are evidently designed by a different and less skilled hand than the rest of the fittings of the exquisitely-furnished sanctuary. The beautiful gas pendants, close by, teem with cunningly and artistically devised wrought-iron work. The reredos contains representations of the Crucifixion in the centre, with other subjects at the sides. The evangelistic emblems are brought in in star-shaped panels, with

good effect. I think the manner in which gilding is sparingly introduced in the reredos, for the arch-mouldings, crockets and pateras, is particularly successful, while the plain surbase, with a gilt incised foliated pattern, is equally happily devised. The chancel has a polygonal trussed rafter roof as far as the sanctuary, where a bold, pointed arch, formed by two ribs enclosing a panel occurs. This panel is embellished with figures of the twelve Apostles, executed on the plain unpainted surface of the wood. Further eastwards the form of the ceiling is that of a pointed barrel, divided into geometrical panels.

In the well-known church of the Holy Trinity, Windsor, the chancel floor is considerably above that of the nave, so that space beneath it is obtained for a choir vestry, access to which is gained by a few steps down. This is not a bad notion, as it economises space and saves expense. At the grand old parish church of Wrexham, North Wales, where the ground falls towards the east, there is even greater facility for the vestry under the chancel, which, however, originally was probably not used for that purpose, but for a crypt or subsidiary chapel.

At the interesting church of Pewsey, Wiltshire, the piers of the nave arcade are apparently of transitional Norman date, and above them is a Perpendicular clerestory. There are no capitals to the piers (which are stop-chamfered at the angles) but only an abacus. The wall over, instead of being thicker, is rather thinner than the piers. The effect of massiveness caused by this uncommon treatment is good, but necessarily unsuitable for congregational worship.

The fine parish church of Crewkerne, Somerset, with its immense windows of the fifteenth to sixteenth century period, has about the most imposing west front of any parish church in the county. The semi-octagonal turrets flanking the nave, the elegant panelling over the west doorway, and the sculpture around it, are all remarkable. There is an elliptical stone roof (externally of flat pitch, and covered with stone slates), with panelled tie-beams. The tie-beams to the flat ceiling of the aisles are also of stone, a curious though by no means beautiful conceit. The great and unusually wide arches of the nave have been much admired on account of their lightness. In my humble judgment they look flimsy, for the walls carried by this arcade are of insufficient thickness. The views from corner to corner, or across the church internally from different points, are telling, though for the worship of the Church of England, the central tower with its massive piers, and the transepts of such great projection, also the chapel at the north-east inner angle of north transept, are not at all suitable.

No one examining the new nave of Bristol Cathedral can fail to be struck with the remarkable treatment of the vaulting to the aisles. It may be reasonably surmised that the object of this peculiar design was to prevent the aisles looking disproportionately high. Though nearly the same height as the nave, they are much narrower. The species of stone beam to each bay reduces the apparent height as the spectator faces east or west. These features were also, no doubt, intended to help to play the part of the usual flying buttress. *Mutatis mutandis*, they really serve that purpose. If they had not been there the thrust would have been only partially conveyed from the nave on to the aisle walls by the transverse ribs of the groining.

There is a little church, built a few years since, at Wenthorpe, near Wakefield, which has some novel points worth mentioning. The funds at the disposal of the architect were meagre, so that he had to get the best effect possible with but poor resources. The nave is 30 feet wide, and a recess at the east end serves for the sanctuary. There is no chancel arch, as a wooden screen is a substitute for it, which is carried up to the top in the form of a traceried truss. This looks well, and one does not miss the more usual feature. All the screens, doors, and woodwork, externally and internally, were, when I saw the structure, painted—the screens green, the seats of a dull red colour—with enamel paint, which does not require to be varnished. The chamfered outline of the bench ends is not graceful; a little less severe form would have cost but a trifle more. The bookboards are tilted inwards, thus preventing books being readily swept off. A continuous row of hat-pegs, like what one sees in the churches of the seventeenth and

eighteenth century, was placed under the window-sills on the men's side, for the ancient custom of separating the sexes in this church is adopted. There are also return-stalls to the chancel. The bell-turret is painted white. The object of painting the woodwork internally was probably for the sake of economy, as timber, &c., of inferior appearance could thus be used. This building shows how much can be done, even with small funds at disposal, where pains are taken.

At Cheddar Church, restored a few years since under the direction of Mr. Butterfield, the backs of the oak benches next passages are not designed with ornamental, cusped or traceried framings, as is so often done, but rather a new departure has been essayed. There are only square moulded panels, two panels high, the upper divided into three, the lower all in one. This, plain as it is, really looks well. The solid bench ends are ornamentally panelled, both old and new, but are all exactly similar. This is very unlike most Mediæval churches, where every bench end is of a different pattern, as at Stoke-sub-Hamdon, Thorne Falcon, and many other examples in the same county.

At the parish church of Easthampstead, Berks, standing on an eminence in a beautiful situation, and rebuilt about the year 1865, is some remarkable painted glass of the MORRIS school in the east window, representing the *Last Judgment*. In the large six-foiled circle in the upper part of the tracery is our LORD sitting as the Judge, with severe aspect. In the six foils are angels with their hands before their faces, as if in fear or awe of the Divine Presence. Beneath is St. MICHAEL arrayed as a knight, with the scales in his hands to weigh souls. At the feet of St. MICHAEL are three angels clothed in white. On either side of the archangel, but in a rather lower part of the tracery, are representations of angels blowing trumpets (which unfortunately, by-the-by, resemble long cowhorns, and so have rather the effect of an anti-climax!). In the lower portion of the window we see the dead rising from their tombs. I cannot but think that, as a rule, the representation after the Mediæval fashion of the scene is rather a mistake. For it needs to be treated, being so full of difficulty, with consummate art and, withal, most reverentially, or it is little better than a travesty of the feeling of the Middle Ages, more likely to provoke derision than inspire solemn thoughts. On the other hand, I must admit that if no effort of the imagination is made in this direction, the field of religious decorative art becomes much narrowed, and it is even better to follow ancient precedent than to strike out altogether a new path, the attempts at which have been not unfrequently very unsuccessful hitherto, and do not as yet appear promising. Considering this is the east window, St. MICHAEL occupies rather too conspicuous a place in it. There are, I venture to say, two blemishes in the composition of the tower of this church. The upper part of the stair turret, with pyramidal top, springs from just inside the parapet, a little set back from it. Consequently it forms no architectural feature, and the effect is not good. Again, each side of the belfry stage of the tower is divided into three panels, the central one being blank, with a quatrefoil in the tympanum of each arch, and the side panels pierced to form windows. I cannot call this pleasing—a panel occupying the central position or place of honour in the width of a tower. Either a pier or a proper perforated opening should be here. As far as my knowledge goes, I am not aware of any Mediæval precedent for this treatment.

## THE SCIENCE AND PRACTICE OF VENTILATION.\*

By ROBERT BOYLE, Ventilating Engineer.

(Continued from page 348.)

**A**UTOMATIC exhaust ventilators, that is to say, ventilators depending upon the wind for their action, may be divided into two classes—fixed and revolving. The Air-pump ventilator may be taken as a fair sample of the first class, the advantages of which are that it has no mechanical movement, cannot get out of order, requires no attention, and there is no after expense to keep it in action.

\* All rights reserved.

What is known as a "Louvre" or "Luffer" ventilator was at one time very extensively used before improved forms of ventilators were introduced, but this was simply because there was nothing better to be had, not that it in any superlative way answered the purpose for which it was applied, as owing to its construction, which was evidently designed more with a view to excluding rain and snow than inducing an upward current, it deflects air down into a building instead of drawing it out, or even permitting the vitiated air to escape. It is rarely now that this form of ventilator is to be seen on any new building, with the exception, perhaps, of sheds and other such structures, where down-draughts are of no consequence. Another form of ventilator that has also in its day been extensively used, is what is known as the "Syphon" ventilator. In its original form it consisted of a tube, divided down the centre with a partition. In a later adaptation two tubes were used, one inside the other, the inner tube having its top projecting above that of the outer one. The theory of this arrangement was that by syphonic action the hot vitiated air would pass up one division or tube, and the fresh cold air down through the other division or tube. It was found, however, in practice, that the cold air, oftener than not, passed down through both divisions or tubes at the same time, but whichever way it acted, rightly or wrongly, the result was the same—*i.e.* a continuous down-draught on the heads of those sitting beneath.

This principle should never have been employed in such a form for the purposes of ventilation. Of revolving ventilators nothing need be said; their day is over and their doom is sealed—and not a moment too soon either—their extreme liability to get out of order, make a noise, and act the reverse of what is desired rendering them rather a nuisance than otherwise. In all properly-constructed roof ventilators the extracting or working power lies exclusively in the head, or that portion of it which is exposed to the wind, the diameter of the pipe having nothing whatever to do with or adding in any way to the extracting power of the ventilator. What is meant to be conveyed is, that if an Air-pump ventilator or any other form of roof ventilator, say 2 feet in diameter, is fixed on the top of a 12-inch pipe, it will of itself extract no more air through a pipe of that diameter than it would through a 9-inch pipe, allowance being made for the greater friction in the smaller pipe, which in short lengths need hardly be taken into account, as the gain does not compensate for the increased outlay incurred and space taken up by the use of larger pipes. Any one who asserts that the extracting power of a properly-constructed roof ventilator does not depend upon the size of the head, but upon the diameter of the shaft that can be attached to it, must be deplorably ignorant of the action of such ventilators and of the purpose for which different sizes are used, as according to this theory you have only to have a sufficiently large pipe, and you can put on the top of it as small a ventilator as you please, as the extracting power does not depend upon the size of it at all, but upon the size of the shaft. If this were really so, where in the name of common sense would be the necessity for using roof ventilators at all, and especially large sizes, if they do not of themselves extract the foul air in exact proportion to the size used, which every properly-constructed roof ventilator should do and does do, quite irrespective of the diameter of the shaft attached to it?

A simple mode of extracting the vitiated air from a room is to utilise the draught in the smoke-flue by fixing a mica flap valve in the chimney-breast just under the ceiling. When the fire is on, and there is a good draught in the chimney, the plan is found to answer very well; but in the summer, when the fires are off, it is not quite so effective.

It is a grave mistake to depend upon the fireplace as the sole means for the exit of the vitiated air, as in cold weather, when a fire is used, the occupants of the room generally gather round it, and get the full benefit of the foul air and products of combustion as they are drawn from the different parts of the room, and pass into and up the flue. They are sitting, as it were, at the mouth of a foul-air shaft, where the air inhaled must certainly be anything but fresh and pure.

The products of combustion should be removed directly from a room, and not be permitted to mix with the air, as there is nothing tends to vitiate the atmosphere so much

or render it disagreeable and injurious to health. "The effect of breathing the products of combustion are easily determined. In proportion to the amount of the contamination of the air, many persons at once suffer from headache, heaviness, and oppression" (PARKES).

BOYLE'S concentric tubes, applied over the lights and led into a ventilating shaft surmounted with an Air-pump ventilator, effectually remove the products of combustion as they are generated, and also draw off the heat arising from the gas, keeping the room as cool and sweet as if gas was not being burnt at all.

Windows in cold weather are always a source of descending cold currents, such descending currents being a common source of discomfort and disease, particularly rheumatisms, colds, and inflammations. No cause of complaint is more frequent in public buildings, and in all situations where large windows are introduced. Double glazing is the only effective remedy for this, but benefit may be derived by the introduction of heat underneath the windows. The fresh air supply should never be admitted at the floor-level, as, no matter what means are employed to break the force of the current, it is found to continually blow the dust and other impurities lying on the floor up into the air, which is both disagreeable and unhealthy. The temperature of the air at the floor-level in cold weather would also be dangerous to health. Different forms of ventilating air-bricks have been introduced from time to time, but the same objection applies to them all when used as above described. A simple method of admitting air is to raise the window about 4 inches, insert a cast-iron grating in the opening, and fix a glass shield in front the full length of the window, and from 15 to 20 inches deep. The air passes in and is deflected upwards the same as in the vertical tubes.

The great difficulty which existed until recently was to admit air in cold weather without disagreeable draughts being felt. That difficulty has now, however, been satisfactorily overcome since the introduction of an arrangement known as "BOYLE'S Improved Fresh-air Warmer," a simple and economical method of providing a supply of fresh air at such a temperature as will be both safe and agreeable in all seasons of the year. The arrangement consists of a copper or iron pipe, from 1½ inches diameter, placed in an air-inlet tube, preferably of the form of a bracket. This pipe is made of zigzag shape, so as to cross and recross the tube from top to bottom, causing the incoming air to repeatedly impinge upon it in its passage through the tube. At the bottom of the tube an air-tight chamber, so far as the interior of the tube is concerned, is fixed, in which a "Bunsen" burner is placed, the flame of which plays up into the bottom end of the pipe which is connected with the top of the chamber. The heat travels through the entire length of the pipe, the other end of which may be made to dip into a condensation box in the bottom of the tube, or be continued up into the flue or extraction shaft. If the pipe terminates in the box, the vapour is condensed there, and is run off through the inlet opening in the wall by means of a small pipe, and any products of combustion which may be evolved are absorbed and rendered innocuous by passing through a loose bed of charcoal, which covers the bottom of the box. The charcoal should be renewed about once a fortnight or month, according to the extent the tube is used. Where these tubes are placed against woodwork all chance of firing may be avoided by fitting them with a double casing or jacket, and filling in the space between with asbestos or other non-conducting substance. With this arrangement the air supply can be raised from a temperature of 30° to 130°, and to show that it is one of the most economical methods of heating at present in use, it is only necessary to mention that the cost of gas consumed to raise the incoming air from a temperature of 40° to 100° is less than one farthing per hour, this being effected with the air passing through the tube at a velocity of 300 feet per minute, or 18,000 feet per hour.

At the Reform Club, where these tubes and heaters, in combination with the patent Air-pump ventilators, have been very successfully applied, a series of experiments were carried out by the Right Hon. ACTON SMEE AYRTON, ex-Chief Commissioner of Works. The results of these tests demonstrated that the apparatus was not only useful for

warming the air supply for the purpose of ventilation, but that it might be used as the sole means of heating rooms. On testing the tubes with the anemometer, the air was found to be passing in at the rate of 16,000 cubic feet per hour, the dimensions of the tube being 24 inches by 16 inches by 6 inches, one-third of which was blocked up with the heating-pipes. It is important to note that these figures compare most favourably with the results obtained by elaborate and expensive arrangements for artificially forcing air into a room by means of water-fans, sprays, &c. The tubes are fitted with regulating valves and deflecting shields to prevent the air from discolouring the walls. They can also be fitted with an arrangement for filtering and freeing the incoming air from blacks and dust.

They are applied to a large number of buildings, including the Guildhall, Lloyd's, Royal Exchange, and Dartmoor Prison, and have been found to answer exceedingly well. The great objection to nearly all methods of admitting fresh air is the disagreeable cold draughts they create. The appliance described effectually overcomes this, and should therefore be welcomed as a really valuable addition to the list of useful sanitary inventions which are now in use.

A simple way of reducing draughts from doors and windows is to supply the fire with the air necessary for combustion direct from the external air, which can be done by leading a small pipe behind the skirting-board or beneath the floor, from an opening in the outer wall into the fireplace in front of or underneath the grate. A supply of warm air may also be admitted to the room by making a similar opening behind the grate, with pipes leading into the mantels and penetrating at the top.

An arrangement for cooling the air-supply in hot weather, known as "BOYLE'S Fresh-air Refrigerator," and which has been found to be very efficacious, consists of an air inlet tube of bracket form, made of iron. The part which penetrates the hole in the wall has an outer casing, so that a space of about half an inch is left between which is packed with a non-conducting substance for the purpose of preventing the heat from the wall penetrating into the interior of the opening, and acting upon the blocks of ice which are placed in a movable drawer, and kept in position by means of open galvanised iron or copper wire netting. The front of the drawer is also double, and packed the same as the casing. The outer air entering through the grating is deflected by a metal shield on to the suspended blocks of ice, and from thence on to the ice at the bottom of the drawer and up the tube into the room, it being not only cooled, but purified thoroughly from blacks, dust, &c. This arrangement would prove very acceptable in our fashionable London drawing-rooms during the season. There are many different contrivances in use for purifying the air as it passes into a room, and freeing it from blacks and other impurities; but a coarse canvas strainer with a pretty open mesh, placed in the inlet tube, is about the best, and certainly the simplest and cheapest, form that can be used. It should be taken out and cleaned with a brush at frequent intervals, otherwise the blacks and dust will stop up the meshes and obstruct the passage of the air.

(To be continued.)

### THE LATE PROFESSOR FLEEMING JENKIN.

ON Friday morning last week the death took place of Professor Fleeming Jenkin, Professor of Engineering of the Edinburgh University, from blood poisoning, after a surgical operation of a comparatively trivial kind. The *Scotsman* says:—It belongs to an expert only to indicate with any completeness the services of the late professor to practical science. He was the only son of the late Captain Charles Jenkin, R.N., of Stowting Court, Kent, and there he was born in 1833. His first schools were at Jedburgh and the Edinburgh Academy. His next was at Frankfurt-am-Main. When again still at school, in Paris in 1848 he witnessed the Revolution of that year. He then attended the University of Genoa, where he took the M.A. degree; and eventually he began the engineering career, which he was to follow so successfully, in a locomotive shop at Marseilles. This various training, while not without other and even more important results, gave him that mastery of three modern languages which was to stand him in

good stead when called on to act as a juror in international exhibitions. In 1851 he returned to England, and was apprenticed to Fairbairn's, in Manchester, for three years. His progress was henceforward rapid. In 1857 he had to do with the manufacture of the first Atlantic cable, and while engaged on this work the electrical testing was put under his charge, the first indication of a line of research with which his name afterwards became so closely connected. In 1859 he was elected an Associate of the Institution of Civil Engineers, gave evidence before the Royal Commission on Submarine Telegraphy, and, at the suggestion of Professor (Sir William) Thomson, began to write on scientific subjects. Professor Jenkin was elected a Fellow of the Royal Society in 1865, and in the same year was appointed Professor of Engineering in University College, London—a post that he held until his appointment, in 1868, to the newly-instituted Chair of Engineering in the University of Edinburgh. During the seventeen years of his tenure of the chair, he has been much esteemed and respected by his students. Many parents and guardians have had reason to be grateful for advice promptly and freely given them as to the training of sons and wards for the profession of engineering. His method of teaching may be summed up in that quality of "thoroughness" which he so strongly insisted upon in a lecture to the students at King's College last year—a quality that distinguished every action of his own life, the preparations for a pleasant social gathering of his students as much as the conduct of his most intricate experiments. The interest that he showed in his students was continued in their after career. Not a few are indebted to him for their first start, and many with whom he made a point of keeping up a correspondence in various parts of the world will feel when they read of his death that they have lost a great friend.

### YORK ART INSTITUTION.

THE summer exhibition of pictures at the York Fine Art Institution was opened by the Marquis of Lorne last week. In the course of his address, the Marquis said he was a little bit sorry that he had had no opportunity in walking through the galleries just then of seeing any of the examples of that school of art in York, but perhaps it might be possible in course of time to show what attention had been given to those studies by having the work of the students exhibited in that building. Perhaps it might be of advantage to centralise as much as possible all artistic efforts, and to make a school of art one of the galleries for exhibiting the works of older painters. He was told that this was only a question of money, but when they had said that they had said sufficient, for, after all, in such a rich community as Yorkshire, it was surely possible to have not only a great permanent building, able to hold in a permanent way the works of art, but to have connected with it also galleries in which students might work on their tasks. He hoped they would do all they could to encourage artists to exhibit in York, and to make their galleries as good and as beautiful a home for art and as attractive to the general public, who might come to purchase pictures, as possible. With regard to localisation, he was struck the other day in the north by the efforts made by a hotel-keeper to keep works of art in his own country instead of their being sent to London. It was an example that might very well be followed by others. The hotel-keeper had a natural love of painting, and what he did was to get all his artist friends and acquaintances to send him their pictures. He hung the pictures up in the rooms of his hotel; they were a great pleasure to himself; they were seen by the tourists who stayed there, and in this way he provided a market for the works while he adorned his house. In Yorkshire they might find a good market in their hotels for much of the local talent. Perhaps within the last few years the encouragement of architecture had improved a great deal more than had the encouragement of painting. We saw great buildings put up by municipalities and county authorities which were charming in their elevation. He did not know that they could see so much encouragement given by the municipalities to painters; but there were in our public buildings large wall spaces that might be well adorned with representations in painting of the history of Yorkshire or the beautiful scenery which the county largely possessed. He hoped that the corporations would in the future do as much for painting as they had lately done for architecture. He might venture humbly to ask the corporations and municipalities of Yorkshire to consider for a moment whether they might not benefit native talent by giving an occasional commission to a Yorkshire artist. He could only express a hope that their buildings would be thoroughly worthy of a Society whose beginnings were laid by the great painter Etty, and of a community which could boast as one of its representatives in the art world of London the distinguished artist Mr. Moore, and of a county that could claim as one of its citizens the President of the Royal Academy, Sir Frederick Leighton.

## NOTES AND COMMENTS.

At the meeting of the Architectural Association last week, Mr. SOMERS CLARKE brought forward an important matter. He made a communication to the members in which he outlined a scheme for a monograph on Westminster Abbey. If all goes smoothly, and the consent of the authorities and those concerned is obtained—as seems likely to be the case—the work is not likely to languish for want of willing hands to do a share, and a most important and honourable share, in the work, in the making of the measured drawings. The work is intended to be one that will be worthy of taking its place as a national record of perhaps the most famous and beautiful of our historical buildings. The present is an occasion for carrying out the scheme which may not occur again, seeing that the necessary scaffolding is now there, and that at no time probably could an appeal for volunteers to measure and make the drawings be expected to elicit so favourable a response as at present in regard of numbers, and also in regard of skilful work.

THE question left unsettled at the previous meeting of the Architectural Association—namely, Mr. COLE A. ADAMS'S motion for increasing the annual subscription of members from half a guinea to one guinea—was decided at the meeting on Friday evening last week by a rejection of the proposition with a majority of nine votes. Those who were in favour of increasing the subscription gave every facility to their opponents of stating their views. Indeed, the opponents of Mr. ADAMS'S scheme did most of the speechmaking of the evening, and many amendments were started, some of which were out of order, others withdrawn, and the rest fell to the ground by being lost when the vote was taken. On the voting for the main question, however, that in turn fell to the ground and was lost. Time will show whether it has not been for the best that the proposition of increasing the subscription was lost.

THE new prison of Saint-Gilles at Brussels is on the plan which was introduced in England. The five divisions are arranged like the spokes of a wheel around a central observatory, and are appropriated to different classes of prisoners. Special care has been taken with the chapels, of which there are three, for Hebrews, Catholics, and Protestants. The seats are disposed in such a way that the prisoners have no means of communication. The Catholic chapel was opened on Sunday last.

THE committee which has been formed for the purpose of providing a memorial to the late Sir JOHN GOSS, organist of St. Paul's, of which Sir ARTHUR SULLIVAN is the chairman and Mr. T. L. SOUTHGATE the hon. secretary, have selected a design by Mr. JOHN BELCHER for the monument in the cathedral. A bas-relief, representing choristers singing, by Mr. HAMO THORNYCROFT, A.R.A., forms part of the design.

IN consequence of an invitation from the Lincoln Corporation, Mr. J. L. PEARSON, R.A., has visited Lincoln to advise with respect to the proposed improvement of the Stonebow. With Mr. F. J. CLARKE, the mayor, and Mr. R. A. MACBRAIR, the city surveyor, he proceeded to inspect the ancient gateway in question. Having had his attention directed to the question of the stability of the structure, Mr. PEARSON came to the conclusion that, although perhaps some settlement might have taken place after the carrying out of the main drainage works, yet he was of opinion that the structure had now got to its bearings, and would settle no more. With regard to bringing the surroundings into harmony with the Stonebow, Mr. PEARSON has promised valuable assistance in the way of sketches showing what should be done.

THE following remarks on planning laboratories and their fittings for technical schools are made by Captain ABNEY, F.R.S.:—"I have not found that most towns differ much from Little Peddlington, where local wisdom invariably asserted itself as pre-eminent. The consequence is that it has often been my duty to direct alterations to be made which would have been saved had the rule been

attended to. There are several cases in which non-compliance has caused the greatest inconvenience. For instance, there is a laboratory recently erected which has slavishly copied the fittings of a neighbouring laboratory which is anything but satisfactory, not omitting their most glaring defects. As another example, there is a laboratory in which a grant in aid of the fittings has had to be refused, simply because the minimum dimensions necessary for benches had not been adhered to. In these cases the local committees have no one but themselves to blame for any loss or expense to which they may be put." Local committees, however, and local boards who indulge in carrying out building operations without architects, drainage schemes without engineers, as a rule do not suffer much expense. The cost comes upon the ratepayer, otherwise local bodies would have learnt experience long since.

SOME details of interest are given in the report of the Commissioner of Public Works, Chicago, for the year ending December 31 last, issued last month. About twenty-five miles of water-pipe were laid during the year, making a total of over 543 miles now in use. The water supply for the year was 29,286,000,000 gallons, a daily average of over 80,000,000 gallons. Nineteen miles of brick and pipe sewers were laid during the year, making a total in use of 414 miles. Thirty-four miles of roadway were paved during the year, making a total of 224 miles of paved streets in the city. Twenty-eight miles of new side-walks were constructed, making a total of 804 miles now in use. An aggregate of 2,225 miles of streets were cleaned during the year. The aprons, crossings, culverts, &c., built numbered 4,817, and 1,703 street lamps were erected. The buildings moved numbered 726. The maps and plans made aggregated 1,610. The special assessments prepared numbered 468. The miscellaneous work included the Rush Street bridge, iron viaducts at West Twelfth Street, Centre Avenue, Chicago Avenue and Halsted Street, the completion of the new City Hall, and the dredging of the river. The total number of contracts for the year was 341, and their aggregated cost 2,589,138 dols.

No visitor to the Royal Academy should omit to see Messrs. BELLMAN & IVEY'S New Art Galleries, 37 Piccadilly, where a very fine collection of sculpture by Mr. NELSON MACLEAN is on exhibition. It includes works in terra-cotta, in marble, and in bronze; works of all sizes, from the small statuettes which are intended to be the ornaments of the bookcase, or the cabinet, up to the large life-size group of the *Spring Festival*. In bringing the collection together, a main object has been to show that sculpture in England has not yet had a fair chance, and to convince those who are interested in art that the work of the sculptor is just as appropriate for the decoration of the ordinary English room as is the work of the painter or the engraver. In France, and perhaps in other countries, there would be no need to put forward such a plea in favour of sculpture. Partly, no doubt, through the influence of their finer climate, partly through their more instinctive delight in form, and partly through their possession of a whole historical series of great sculptors from the days of JEAN GOUJON down to our own, the French have always placed the sculptor's art fully on a level with that of the painter. They have seen that beauty dwells as much in plastic form as in coloured surface, or in the intricacies of light and shade. And we have no doubt that by popularising the sculptor's art by such exhibitions as Messrs. BELLMAN & IVEY'S, the time will come when sculpture will be as universally admired in England as on the Continent.

THE place of honour in their gallery is occupied by a very beautiful marble group entitled *The Spring Festival*, consisting of two dancing girls, life-size. The work exhibits an entire absence of conventionalism, has been worked direct from the living models, and is full of life and artistic realism. If nothing else were to be seen in the galleries but this group and the two statues entitled *Comedy*, and *Ione*, no admirer of good sculpture should lose the opportunity of seeing them. We are informed that Mr. NELSON MACLEAN was engaged for several years on the various works exhibited at the new galleries in Piccadilly.

Charles E. Clayton & Ernest Black · Architects ·

The Sables · Roedene Hall · Sussex · for Lady Ogle ·

RESIDENCE OF JASPER GIBSON, ESQ.  
BANISTER FLETCHER, ARCHITECT.

"INK PHOTO," SPRAGUE & CO., LONDON.

CHRIST CHURCH

DRAWN BY

## ILLUSTRATIONS.

THE ARTS: THE SCULPTOR.

THIS illustration is the fifth of the series by M. EHLMANN.

## RESIDENCE AT WEST HAMPSTEAD.

WE illustrate this week the residence of Mr. JASPER GIBSON, which has just been completed. It is situated in Cleve Road, West Hampstead, a part of London which is becoming daily more in request. The house comprises on the top floor large billiard-room, with open timbered roof, two floors of ten bedrooms, bath-room, and Mrs. GIBSON's private sitting-room on ground floor, three large reception-rooms, conservatory, and balcony out of morning room for visitors to watch the lawn tennis; kitchen and offices. In the basement are large cellars, larders, and stores. The architect is Mr. BANISTER FLETCHER.

## THE STABLES, ROEDEANE HALL, NEAR BRIGHTON.

THE stables shown in the accompanying illustration have been recently built for Lady OGLE, of Withdeane Court, Sussex, upon an elevated site at the rear of her new house at Patcham. The buildings comprise, in addition to the stabling, double and single coach-houses, the coachman's lodge, and a range of fowl-houses. The architects were Messrs. CHARLES E. CLAYTON and ERNEST BLACK, of Brighton.

## INTERIOR OF CHRIST CHURCH, OXFORD.

## THE ARCHITECTURAL ASSOCIATION.

THE special business adjourned from the meeting of May 28 was resumed on Friday evening the 12th inst., Mr. C. R. Pink, president, in the chair.

Mr. George Ashlin, R.H.A., was elected a member by acclamation.

A vote of thanks was passed to Messrs. Ernest George & Peto in connection with the visit paid to buildings being erected by them at Crawley; also to the Institute of Architects for being allowed the use of their committee-room.

Mr. SOMERS CLARKE, by invitation of the President, made a communication in regard to Westminster Abbey. No work, he remarked, existed that thoroughly illustrated Westminster Abbey. If we wished to find illustrated works of our national buildings, we must go abroad to France and to America. In America they illustrated them because they had no historical works of their own to illustrate. Beyond Neale, Ackerman, and a few works of the sort—and these were histories and not architectural monographs—we had nothing, and the erection of the scaffolding for works of repair at the Abbey suggested that such a work could now be produced. Such an opportunity of measuring the building might not occur again. Later, the same idea had been broached by Mr. Waterhouse in an Academy lecture. The Dean had received the suggestion from him (Mr. Clarke) with favour, and by advice of the Dean he had sent a description of the proposed work to the Clarendon Press, Oxford. The proposed work was a monograph, fully illustrating the artistic and architectural features of Westminster Abbey. Touching the production of the work, if the Association took it up it would be done; if they did not the work would not be done. With the exception of the drawings of Henry VII.'s Chapel nearly all the measured drawings to explain and illustrate the Abbey had to be made. The erection of scaffolding would entail great expense, while the present scaffolding would give access to otherwise inaccessible parts of the interior. The scaffolds were, however, of no use without hands to take measurements, and the suggestion had occurred to him that by the co-operation of the students of the Royal Academy, of the Institute of Architects, of the Architectural Association, and of private students, the necessary measurements could be made at a small cost, many of them for nothing. He had the assurance of Sir Frederick Leighton, Mr. Pearson, and Mr. Norman Shaw that when the scheme is matured they would give their assistance in arranging that the prize drawing of the Academy competition for architectural students should be part of the Abbey agreed on for some of the illustrations. Parts of the Abbey were already measured by the students, and these were ready to hand. All the gentlemen mentioned showed great interest in the scheme, and he was waiting till he got the matter into shape, with the complete consent of Mr. Pearson. But he wished to make sure of his ground before making his second application to Mr. Pearson.

Mr. Ewan Christian, the president of the Institute, had also expressed his approval of the scheme. As to the Association, its life and energy were well known to him, and he felt that the greater number of hands that would assist him in the work would be from the Association. The illustrations of the fabric would be in black and white, but to fully illustrate the royal tombs and other details coloured plates would be required, skilled colourists for which would be wanted, and assistance from South Kensington in this respect was probable. Paid workers would be required for some few measurements which could not be looked on as part of any instructive course for students. The letter-press for the work, containing illustrations 17 by 22, would not be more than was necessary thoroughly to explain the plates, and would be placed in the hands of Mr. J. T. Micklethwaite, and an examination of the fabric rolls would be done by Mr. W. H. St. John Hope. After other details, Mr. Clarke mentioned that the names of the authors of the drawings would appear on the plates, and concluded by saying that in combining to do the work they would do something to remove what was almost a disgrace not to have been done before.

The PRESIDENT thanked Mr. Clarke for bringing before them a matter of not only architectural but national interest.

Mr. GOTCH said he thought the meeting might authorise the committee to send out a circular to every member asking offers from those willing to help in the work.

The PRESIDENT said a petition signed by over fifty members had been sent in, asking that the Saturday afternoon visits might be continued during the summer by excursions to buildings out of London, as the trip to Crawley had proved so successful. The matter had been brought before the committee, and the matter would, he hoped, be arranged.

The discussion of Mr. Cole A. Adams's resolution involving the raising of members' subscription from half a guinea to one guinea was then resumed, the consideration having been adjourned from the previous meeting on the proposition of Mr. Stannus, seconded by Mr. Baggallay.

Mr. STANNUS asked the President to make a personal appeal to Mr. Adams to allow the matter to rest for one year. They were all agreed as to increasing the efficiency of the education, but he considered Mr. Adams's victory would be only less disastrous than defeat. He hoped the resolution would not pass. At the same time, Mr. Adams had laboured so much for their interest that they were in the awkward predicament of appearing to cast a slur upon him in opposing the proposed change.

Mr. BAGGALLAY said the reason alleged against the change was that it would be hard on the poorer students. But he thought that it was the poorer students who would get the most benefit by it. He felt a strong dislike to their becoming pensioners of the Institute. Mr. Sedding might have influence with the Institute, but he doubted whether the Institute would give them the money.

Mr. GOTCH said that as an amendment he would propose to omit from the resolution the matter regarding the publication of papers.

Mr. COLE A. ADAMS said he would withdraw that part of the motion.

Mr. M. B. ADAMS said that owing to this withdrawal he would support the resolution. He had felt they were travelling beyond their province, which was not that of a learned society, to publish proceedings, &c.

Mr. MILLARD hoped members would vote for or against, according to what they thought would promote the present and future good of the Association, and not from personal considerations about their pockets.

Mr. SEDDING said the plea for the rise in the subscription was the advancement of education, but those in favour of it must not claim to have education more at heart than those who were against the change. How could education be advanced if a number of members withdrew in consequence of a raised subscription? It had been stated that, if the poorer students could not afford to pay the small sum, they had better not enter the profession. That was not the doctrine in bygone days. Formerly the poor student was helped, and the dullard was let go to the wall. The proposal was likely, he thought, to irritate everyone all round. He knew that several members would withdraw from the Association, and he thought they should hesitate before passing the resolution.

Mr. E. W. POLEY proposed as an amendment that the question should be deferred for twelve months.

Mr. HAROLD TAYLOR seconded it. He said no definite statement had been made of how the money was to be spent.

Mr. FARROW said it was impossible to say how the money would be disposed of till they knew how much money they would have to spend.

The amendment was put, and lost by a large majority.

Mr. BRODIE proposed that the question should be decided by voting papers sent to all the members.

The PRESIDENT ruled that the amendment was out of order.

Mr. H. KEMP proposed that the subscription of members residing within twenty miles of London should be a guinea.

Mr. SLATER said that would not define properly the difference between town and country members. It turned on the facilities for reaching town rather than distance in miles.

Mr. BLASHILL: This is a most important question. Why should we not vote white or black on it?

The amendment was withdrawn.

Mr. STANNUS then proposed an amendment, which he trusted would be the last—"That the Association approves of the advancement and consolidation of the scheme of education, and authorises the committee to go to an expense not exceeding 100*l.* during the session 1885-86, and postpones, towards the end of the session, the question of raising the subscription till the experience gained will guide the decision. Mr. Stannus then read a letter from Mr. R. Phené Spiers to the effect that that gentleman believed that Mr. Aston Webb, whose views he had heard, and those who held the same views, were wrong in wishing to raise the subscription. He pointed out that a guinea subscription would not make a university of the Association, and that it was unfair to make members who could not attend the lectures pay for those who could attend.

Mr. LOVEGROVE seconded the amendment. He said there would be two classes under the proposed *régime*: those who participated in the advantages, and those who, debarred by distance or for other reasons, could not share in them. Moreover, while he wished to do his best to forward the work of the Association, he did not wish to lose many members who would leave them and start another Association. He regretted the rules would not allow them to decide the question by sending out voting papers.

Mr. J. D. MATHEWS supported the amendment.

Mr. BLASHILL considered the change would prove a departure from the lines that had raised the Association to its present position of efficiency. Its prosperity during the last thirty years had been most marked. That which had raised it to its excellency should not lightly be departed from, namely, the personal work and efforts of the junior members aided by the help of the older members. Students of thirty years ago had grown older, and they seemed to fancy the Association had grown old too, whereas the Association was carrying out as vigorously as ever the same useful work of education of students. They ought not to try and do the work that the Institute of Architects ought to do for them, and which, he believed, would soon be undertaken by the Institute. He ventured to think Mr. Sedding did not quite understand the position of the two societies. They could not accept a heavy subsidy from the Institute without resigning the management of their own affairs. The business of the Association was to get hold, as far as possible, of all students of architecture in the country, and not do anything which would tend to lessen their numbers.

Mr. W. H. ATKIN BERRY opposed the amendment. He said they would not be able to show the results of the new scheme in the time specified.

Other members spoke. One said the idea of printing the transactions was now given up, and so they would get less for their guinea than was at first proposed. Another member regretted that they would lose the Association, which they esteemed so much, and get a university, which they did not ask for. Another member said the vote would never be taken if a limit was not put to the speeches.

Mr. COLE A. ADAMS then replied on the question with an able and persuasive speech.

The President then put the amendment to the meeting, and it was lost by a considerable majority.

The President next put the motion, and, tellers having been appointed, it was, on a count of hands, declared lost. A division then took place, and there were—for the motion, 61; against, 70, the majority against increasing the amount of the subscription being 9.

The proceedings terminated with the announcement.

## THE NATIONAL ART LIBRARY.

THE report of Mr. R. H. Soden Smith, M.A., Keeper of the National Art Library, states that the attendance in the Art Library during the past year amounted to 16,148 students, and 5,951 subscribers, the reading-room being open for 292 days, instead of 311 in the previous year. The average daily attendance remained the same; this result was due to the opening of the new reading-rooms in October, and the consequent increase in the attendance of readers from that time. Thus, the loss during the earlier part of the year, and the period of necessary closing while the books, &c., were being removed, was compensated. During the month of December, the increase of attendance amounted to nearly 400 over the numbers of the same month in 1883.

During the year preparations were gradually made for moving the whole library from the temporary quarters in which

it had been so long confined to the new rooms erected on the south front of the museum. All the books that could be transferred without interfering wholly with the work of the reading-room were gradually moved, and at length, in the middle of September, it was necessary to finally close the old rooms.

Not more than a fortnight had, however, elapsed when, on October 1, readers were admitted to the new reading-rooms. In the meantime the classification and press-marking of the books were pushed on by the library staff, both during the day and in the evening, with all possible diligence; and I have much satisfaction in reporting upon the prompt and efficient manner in which the attendants carried on the work, as well as on the knowledge which they evinced of the contents of the library in supplying the wants of readers before it was possible to have the shelf arrangement and the press-marking completed.

The new reading-rooms consist of a central chamber 64 feet by 58 feet, a room at the east side 85 feet by 53 feet, with accommodation for about eighty readers, and a corresponding room at the west side fitted in similar manner. They are excellently lighted from the top and by windows on the north. At night the lighting is electric, two methods being in use, the large upper lamps giving a general illumination and enabling the titles of the books in the galleries to be distinctly read; the lower, star-shaped burners, about five feet above the tables, supplying the light required by students. In addition to the advantage of abundance of light, by which the smallest print can be read and colours distinguished, the absence of heat is a great gain, and still more perhaps in a library the absence of the products of gas, which prove destructive to leather bindings.

All the rooms have galleries shelved for books, and in these and in the cases below the various classes into which the contents of the library are divided are systematically arranged as far as the space permits.

The centre room is devoted mainly to the collection of prints and photographs, and is provided with presses in which the larger part of the collection is kept; tables are placed here on which books of unusual size, drawings, and prints can be examined. The pier space in the three rooms will serve for the exhibition of framed drawings and prints of ornamental art, and such table space as can be spared will be used to show in cases some of the examples of early printing, book ornament, and bookbinding, which have been gradually collected for some years past.

The original intention was to have placed in the reading-rooms only books of reference and works in immediate demand, and thus keep the book-cases low, as the height in a reading-room ought never to exceed what can be reached without the aid of a ladder or steps; but, owing to the circumstance of the side rooms which were to have stored the books not being yet built, it has been found requisite to shelve the public rooms to a height of nearly 12 feet, and, in order to provide temporarily the requisite space for the collection, to use, in addition, the gallery of the court in which casts from the antique are now placed.

The fittings of the reading-room are of mahogany, which offers some advantages over oak, and the tables are constructed so that the desks for supporting books are convenient for students copying as well as reading. The heating is by hot-water pipes carried under each table as well as by apparatus at the sides of the rooms.

The classification of the books is being carried out as completely as possible, and, it is hoped, will ultimately be such as to enable volumes not only to be found rapidly, but also will serve to aid materially the inquiries of readers as to the literature of any special subject.

The system of bookbinding in various colours, according to classes, which has been pursued for some years, will aid in finding as well as in replacing books, and continues to be carried out.

The number of volumes and pamphlets acquired has been 1,820 purchased, 391 presented.

Perhaps the rarest acquisition is a book of Venetian lace-patterns, containing many designs of great elegance; it was printed at Frankfort-on-the-Main, by Matthes Beckers, 1601.

Of more modern books may be noted the engraved works of Sir Robert Strange—a fine copy presented by him to a relative, and containing exceptionally good impressions of many of the plates.

Daniell's great work, "Antiquities and Views in India," a fully-coloured copy in six volumes, fol., 1799; Liber Naturæ, a reissue of a set of mezzotint plates by S. W. Reynolds, after the works of the early water-colour artist Thomas Girtin; Biardot (E. P.), "Les terres cuites funèbres;" with coloured plates, Paris, 1872.

A valuable series of catalogues of Dutch picture sales in fifteen volumes, ranging from 1771 to 1841, has been acquired to add to the extensive collection of art catalogues gradually brought together during the last few years for purposes of reference.

The collection of Japanese illustrated books has received a very important addition in a series of sixty-six volumes illustrating their skill in wood engraving, and especially in printing in colours. Some of these are fine specimens and old, dating from a period before the present eagerness to supply the European market led to the haste and inferiority of production which, unfortunately, mark much modern Japanese work; the skill evinced in the effects produced in some of these books by colour-printing has not been hitherto equalled in Europe. Another remarkable series of volumes was acquired at the partial dispersion of the Japanese art and educational apparatus in connection with the Health Exhibition. These consist of a large series of volumes, including, among other matter, modern reprints of woodcut illustrations of ancient writing, of ornamental details of objects in metal-work, furniture, costume, grotesque sketches of character, animals, flowers, &c. A work of some importance for the history and illustration of ancient Chinese bronzes has been acquired in twenty volumes, giving illustrations of vases, incense-burners, bells, and other objects, with the signatures of the artists and Chinese text accompanying each woodcut.

The illustrations of early printing and book ornament have received additions, among which may be mentioned a "Book of Hours," published by Kerver of Paris in 1500, with the artistic borders to each page characteristic of such volumes; also "Missale Romanorum," Venice, 1534, bound in stamped morocco, with clasps; and various examples of the work of the early printing-presses in the latter part of the fifteenth century.

A considerable number of specimens of bookbinding, English and foreign, have been added; among them a good many examples of the stamped vellum and pigskin covers which were successfully produced in the sixteenth century, and the excellence of which is at length being appreciated.

Duplicates of works much in use, especially those required for circulation to provincial schools, have been acquired as far as funds would admit. Among these may be mentioned a copy of Piranesi's great work on classical antiquities, the Roman issue, that in use in the library hitherto being the Paris edition; Pfnor's "Architecture, décoration et ameublement de l'époque Louis XVI.;" "Gravelot et Cochin, Iconologie par figures," four vols. 8vo, Paris, with good impressions of the plates; "Œuvre de A. Mantegna reproduit par Amand Durand," fol. Paris, 1878.

The number of original drawings and designs added has been 1,808. Among those presented may be specified nearly 1,000 original sketches, designs, and water-colour drawings by George Cruikshank for some of his most popular etched or engraved productions; these are included in the large collection of his works, the gift of Mrs. George Cruikshank, of which more particular mention is made below. Among the drawings, full of the curious humour and dexterity of the artist, may be named the water-colour originals for the illustrations of the comic almanacks, the sketches for the "Epping Hunt," for "London Characters," "The Comic Alphabet," frontispiece of the "Mornings at Bow Street," originals of the "Sketches by Boz," &c.

Three characteristic drawings by William Blake, presented to the museum by Sir Charles Dilke, Bart., are placed in the library collection. A series of large drawings of Indian Mohammedan architecture has been acquired, including good illustrations, in some examples full-sized, of the inlay work in coloured marbles, agates, &c., of portions of the Taj Mahal near Agra. A volume containing a collection of costumes of British India; native drawings; original designs for silver-smiths' work by French designers of the early part of the present century; some designs for painted glass windows by Willemette and others.

The number of engravings, etchings, and woodcuts added to the collection has been 2,778 presented, 3,791 purchased. Among those presented must be specially mentioned the large gift, which is due to the liberality of Mrs. George Cruikshank, of a series of the works of her late husband, almost unrivalled in its extent and completeness, including as it does proof impressions of the artist's chief productions, with his autograph signature upon each. Thus, complete sets of the "Life of Joseph Grimaldi," "The Omnibus," "The Tower of London," and many others of his most noted works are represented by signed Indian proofs; altogether nearly seventy years of work are illustrated by this remarkable and interesting collection. In addition, Mrs. George Cruikshank has presented duplicates of many engravings and sets of subjects for the purpose of exhibition at Bethnal Green Museum and for circulation to exhibitions in connection with the Department. Additions have been made to the collections of early woodcuts, to the series of Italian chiaro-oscuro prints, and to the works of the "Little Masters" of the German school, Aldegrever, the Behams, and others.

The number of photographs acquired has been 1,458. Among these may be noted continuations of the various series of permanent autotypes published by Braun & Co. Among them the pictures in the gallery of the Hermitage, St. Peters-

burg; the Dresden Gallery; pictures of the Ecole des Beaux-Arts, Paris, &c.; also a series of Italian sculpture and others of Indian architecture; 2,275 diagrams, drawings, prints, and photographs have been lent to provincial and other schools of art for exhibition at institutions in the provinces, or for use in the lecture theatre. The total number at present on loan to the Art Museum for exhibition or circulation, or otherwise in use out of the Art Library, is upwards of 10,500.

The work of publishing "Classed Lists" of the contents of the library has been pressed on as far as possible, but was unavoidably hindered and delayed by the labour of moving the whole collection to its new quarters; nevertheless, a second edition of the "List of Books on Heraldry" has been issued, and is sold at sixpence, and a second and much enlarged edition of "Books on Painting," sold at one shilling. The list of works on pottery and porcelain, which includes more titles than have yet appeared in any bibliography of the subject is in the press; the list of books on furniture and cabinet-making is well advanced; materials are collected and being daily added to for many other classes. Besides the great use of these classed lists to students in the reading-room, they prove of service in arranging the books on the shelves, and aid materially in the rapid finding of works by the attendants. They are in use in the British Museum reading-room, that of the Society of Antiquaries, and elsewhere.

## Bygones.

"Antiquity after a time has the grace of novelty."—HAZLITT.

### THE BUILDING ACCOUNTS OF THE GREAT HALL AT HAMPTON COURT.

(Concluded from page 341.)

#### Timber.

PAYD to Robert Wodlonde, of London, carpenter, for 150 of sesnyed playnche burdde, serving for the lenyng plase in the nether ende of the haull, and the lenyng plase before the Kynges chamber dore, at 3s. 2d. the hundred.

Also, to Fraunsys Stykrayd, of London, carpenter, for 2,000 of fine selyng bourddes, at 31s. 13d. the thousand, for the vaught in the Kynges new haull.

Item, for 420 foote of vent and creest for the haull, at 6d. the foote.

Also payd to Willm. Wethersbe, of London, carpenter, for 6 payre of scruse, at 5s. 2d. the payre, serving to rayse the flowre of the haull, with 4d. for lande carriage of the said scruse from Busschys Gate to Barnerdes Castyll; in all 31s. 4d.

Also payd to John Bartlymew, of Marlow, for batlage of the said scruse from London to Hampton Court, 4d.

#### Plumbing.

Payd to Thomas Ostley, stapuller, for 18 fother 12 cwt 3 quarters 21 lb. of leade, to cover the Kynges New Hall, at 4l. 7s. 8d. the fother.

Also payd to Thoms. à Coon, the Kynges sergeunt plumber, for one hundred wait of sowther, of hym bowght and delyveryd at Hampton Court, conteynnyng 512 lb. at 4d. the lb. for sorderyng the pypys abowght the Kynges new hall.

#### Glazing.

In the two over lyghts at the gable endes of the hall, 8 panys new sett, containing 54 fote, at 5d. the fote.

Also the hernessyng of the two great windows at the gabyll endes of the said haull, containing 70 fots, at lyke pryce, 29s. 2d.

Paid to Galyon Hone, the Kynges glasier,—In the two great wyndows at the endes of the haull ys two great armys, with four beestes in them at 6s. 8d. the pece. Also in the said wyndows in the haull is 30 of the Kynges and the Quenys armys, pryce the pece 4s. Also in the wyndows in the said haull ys 46 badges of the Kynges and the Quenys, pryce the pece, 3s. Also in the windowys in the sayd haull ys 77 sryptors with the Kynges worde, pryce the pece, 12d.

Payd to Galyon Hone, the Kynges glasiar, for glasyng in the haull 11 syde wyndows, every wyndow of 8 lyghts, every lyght conteynnyng 11 foot, whyche emownteth in every wyndow, besydes the harnessyng, 88 foot, at 5d. the fote.

In the gabull wyndow at the est end of the haull ys oon armys of the Quenes new sett, 6s. 8d.

#### Tiler's Work.

Payde to John Burdde, of Chesyllhurst, for 6080 of playne tyles, of hym bowghte and delivered at Hampton Court, for to pave the Kynges new hall, at 26s. 8d. the thowsand, by convencion—8l. 11s.

Empcion of tallow candells spent by the workmen in the nyghte tymes uppon the payvng of the hall, for the hasty expedition of the same, at 18*d.* the dosyn.

Also paid to John Church, of Chersey, for payvng-tyl for the haull, of hym bought and delivryd at Hampton Court, at 18*s.* 4*d.* the 1000.

Payd to William Kyng John Hobbs, fremason, for hewing and setting the payvng of the herthe in the Kynges new hall, of Rygate ston, conteynyn 36 fote, at 1*½d.* the fote.

Payd to Robert Burdges, bryklayar, for payvng of the haull, by convencion, 53*s.* 4*d.*

#### *Painting and Gilding.*

Payd to John Hethe, payntour, of London, for the payntyn of 6 great lyons standing abowght the batyllmentt of tymber worke uppon the Kynges new haull, theyre vaynys gylte with fyne golde and in oyle, price the pece, 20*s.*

Also to the same, for gyllyng and payntyn of 4 great dragons, there vanys layde wythe oyle, pryce the pece, 20*s.*, servyn for the said battylment.

Also to the same, for gyllyng and payntyn of 6 greyhounds, three vanys wyth oyle, price the pece, 10*s.*, servyn the said battylment.

Also of 4 lyons, servyn for the femerall, with there vanys layde in oyle, price the pece, 20*s.*

Also of 4 dragons, servyn for the said femerall, with there vanys layde in oyle, price the pece, 20*s.*

Also of 4 greyhounds, wyth their vanys layde in oyle, pryce the pece, 10*s.*

Also of a great lyone, crownyd, baryng a great vane, layde in oyle, servyn the toppe of the femerall, pryce 26*s.* 8*d.*

Payd to Henry Blankston, for gyllyng and payntyn of two vanys, servyn the bests of freston stondyn at the end uppon the haull, oon of the Kynges armys, the other of the Quenys, wrowghte wyth fyne golde and in owyle, price the pece, 4*s.*

The gyllyng and payntyn of bests: also to Henr. Blaynston, of London, paynter, for the gyllyng of 4 lyons holdyn 4 phanes, wyth the Kynges armys gylte uppon both sydes, every lyon gylde, all the uppermost part and the nether part paynted after a lyon colour, and every lyon stondyn uppon a base paynted whyght and grene, at 20*s.*

Also paid to John Hethe, paynter, of London, for bysyn of 236 fote bourde in the femerell of the Kynges new haull, at 2*d.* the fote, 39*s.* 4*d.*

Also to the same, for layng of the joull pecys rownde abowght the haull with grene merbyll in oyle, and for byssyn of a case-ment in the joull pece at the nether ende of the haull, by convencion, 3*l.*

Payd to John Hethe, and Harry Blankstone, for 10 armes of the Quenes, of the largest sorte, standyn abowght the bordder uppon the 'jowle pece, in the Kynges new hall. 18 making the yerde square, that is, half a yerde, and oon badge over pryce for moldyn, payntyn, and gyllyng with fyne golde and bysse, 12*s.* 8*d.*

Payde to the said John Hethe, for gyllyng and payntyn 272 badges of the Kyngs and the Quenys, standyn abowght the voughte, and the caters within the Kynges new haull, at 12*d.* the pece.

For gyllyng and payntyn of 28 hedde, standyn uppon the hammer beamys in the ruff of the said haull, price, the pece, 2*s.*

Also, for laying of townges of the Kynges best and the Quenys, of antyk worke, standing in the spanderell, and the beamys with yellow, concernyn to the same, in oyle, price 2*s.*

Also, paid to Robert Skyngke, for mowldyn of 36 badges, standing in the crest above the evys pece, in the Kynges new haull, in the haull pace, at the nether ende of the haull, and in the casements rownde abowght the haull, at 3*d.* the pece.

Payd for gyltyng and payntyn of the said 36 badges, at 12*s.* the pece.

Payd to Henry Blankston, for 4 of the Kynges wordes in the casement of the haull pase, in the nether ende of the hall, in Gryke letters, with fyne gold gylte, price, the word, 2*s.*

Payd to John Lyam, of London, groser, for cwt. of red-lede, for colaryng the barres of the hall wyndows, 13*s.* 4*d.*

Payd to the same John, for 6 gallons and a pottell of paynters' oyle, at 18*d.* the gallon, servyn the said wyndows, 9*s.* 9*d.*

Payd to William Haydon, of London, for a pound of brystyll, servyn to pensell the hall abowght, 6*d.*

Payd to John Spenser, of Hampton, for a lode of hay, to be burnyd for pensellyng abowght the hall, 9*s.*

Empcion of paynters' stuff, paid to Henry Burd, grocer, of London, for 12 lb. of white leade, at 2*d.* the lb. Item, for 4 lb. of rede lede, at 2*d.* the lb. Item, for 2 lb. of spaltain, at 4*d.* the lb. Item, for a lb. of verdygresse. Item, for a lb. of maskett. Item, for 4 ounces of synaper blake, at 10*d.* the ounce. Item, for 2 lb. of Spernys oker. Item, for a lb. and 3 quarters of byse, at 8*d.* the lb. Item, for half a pound of vermylon. Item, for a swanes quylle and goos quylle, 4*d.*

Item, for a hundred greys tails, 6*d.* Item, for 2 lb. of verdylor, at 16*d.* the lb., 2*s.* 8*d.* Item, for a galon of paynters oyll, 16*d.* Item, for 4 lb. of blake chalke, 4*d.* Item, for a lb. of vernysse, 6*d.* Item, for 6 lb. of Spanysse white, 3*d.* Item, for half lb. of spong, 2*s.* Item, for a lb. of markyn stones, 8*d.* Item, for a quire of paper riall, 6*d.* Item, for a lb. of Fflaunders heyre, 4*d.* Item, for a dozen of grene floyl, 4*d.* Item, for a quart of pyncke, 6*d.* Item, for 4 skeynys of fynne thredd, 2*d.* Item, for a lb. of drye flowre.

Payd to Henry Blankeston, of London, paynter, for payntyn of 193 posts with whyte and grene and in oyle, every poste conteynyn 2½ yerdes, deippe, at 16*d.* the yerde, standyn in the Kynges new garden.

The badges about the bower in the King's withdrawing chamber, gilt with fine gold and bysse, set with other fine colours, 21*s.* the yard.

#### *Rate of Wages.*

Masons.—John Molton, master, 12*d.* the day. Wylliam Reynolds, warden, 5*s.* the weke. Setters, 3*s.* 6*d.* the weke. Loggemens, 3*s.* 4*d.* the weke. Hard hewars, 4*s.* and 3*s.* 4*d.* the weke.

Carpenters.—Master, 12*d.* a day. Warden, 8*d.* a day. "Prentises" from 4*d.* to 8*d.* a day.

Bricklayers.—Master, 12*d.* a day. Warden, 8*d.* a day. Workmen from 4*d.* to 7*d.*

Joyners.—Master, 10*d.* Others, 7*d.* a day.

Paynters.—Master, 12*d.* Workmen, 8*d.* Colour-grinder, 5*d.* a day.

Playsterers.—Masters, 8*d.* a day. Serveters, 5*d.* a day.

Plummers, 7*d.* a day.

Sawyers, 12*d.* a day.

Scaffalder, 6*d.* a day.

Making of hoddys, and helpyn to scaffalde, 6*d.* a day.

Laborers, 4*d.* a day.

#### *Extra Works.*

Paid to Edmund More, of Kyngston, fremason, for makyng, karvyn, and intailyn of the Kynges armes in thre sondry tables of fre ston, with severall boursers of antique worke and certen of the Kynges best, holding up in a shilde the Kynges armes, with the garter, poises, and scripture ingraved, and the crown imperiall wrought after the best facion; wherof oon of the said tables conteynynge 5 fot and oon inche oon way, and 6½ fot an other way, standythe over the great gate comyn into the Base Court, and the second table of like mesure standithe over the inner part of the same gate, and the third table, conteynynge 5 fot oon way, and 3 fot and 5 inches the other way, standithe over the utter part of the gate comyn into the inner court; in all for fornyshyn and setting up of the said thre sondry tables, with severall armes aforesaid, by convencion, 34*l.* 4*s.* 10*d.*

Payde to Edward Arnolde, mason, for hys cost and expenses rydyn in to Northe Hamptonshe, Bedfordshere, and Huntynghon shere, wythe the Kyngs Comysshen to rest and take up freemasons, by the space of 5 dayes, at 8*d.* the day, over and besyd hys dayes wages for hymselfe and hys horsse, 3*s.* 4*d.*

Digging, moulding, setting and burning of bricks delivered at the brick kiln within the King's Park at Hampton Court at 2*s.* 10*d.* the thousand, by convention.

Item, to Antoyne, clockmaker, of Westminster, for 3 new dyalls for the new orchard, at 4*s.* the pece, 12*s.*

Item, paid for a ronnyng glasse for the workmen and other, to keep their oures trewly at all tymes, 8*d.*

New Normandy glasse, at 5*d.* the fote.

## THE RESTORATION OF WESTMINSTER HALL.

THE report of the Select Committee on the restoration of Westminster Hall, with the reports of proceedings of the Committee and minutes of evidence, and many accompanying architectural plans, drawings, and elevations, has been issued in the form of a large folio blue-book of 170 pages. In the report, which is dated April 25, the Committee describe the scope and objects of their inquiry, and the competing plans proposed by Mr. Pearson and Sir Charles Barry. They state that "on the whole, they have arrived at the conclusion that neither architectural considerations for the group of buildings as they now stand, nor utilitarian reasons connected with the wants of Parliament or the public service, require that Sir C. Barry's wings, or either of them, should be erected." Turning to Mr. Pearson's design, they find that he proposes "to construct a double-storeyed gallery under the buttresses, following exactly the lines of the original building, and inserting in it windows which he considers in general harmony with and suited to the general requirements of the building. Finding also extreme difficulty in carrying on the gallery to the north end of the Hall, and terminating it in a satisfactory manner, he proposes

to erect a building at right angles to the Hall, and facing Palace Yard, in character with the work of Richard II., on the foundations of that previously referred to." The Committee describe what has been urged for and against these plans, and they proceed to say that, after careful consideration of the evidence and models, they are of opinion "that Mr. Pearson's original design of a two-storeyed building under the flying buttresses should be carried out," but suggest certain modifications of which Mr. Pearson has submitted plans. "The upper gallery of the building under the buttresses may," they say, "be divided into four large rooms of sufficient height, approached by steps in the corners of the Hall, or from the lower gallery. These rooms will be conveniently situate for conference rooms or deputation rooms for members, or would be equally useful for Royal Commissions. The lower storey may also be divided into rooms or may be left as a gallery where the Norman walls would be open for examination by those interested in archaeology." They also approve of the proposed building at the north end of the Hall, which, apart from the architectural ends aimed at, "can be fully justified on utilitarian grounds, as it will supply an indispensable need of the House in a stand for horses and other purposes, in place of the present shed." The total estimate of the works by Mr. Pearson is 35,000*l.*, and in conclusion the Committee remark that while they do not contend that the architect's design is an exact reproduction or restoration of the west side of the Hall, on the other hand, "they feel assured that it has been prepared with careful regard to all historical evidence, and that the general scope of his design is in harmony with the simple grandeur of this national building."

#### Society of Arts.—Westgarth Competition.

SIR,—I think when a correspondent takes upon himself the responsibility of sending correspondence to the press, he ought not to act so unfairly as to omit a part of it, as has been done in this case by Mr. G. W. Usill, Assoc. Mem. Inst. C.E., by keeping back my reply to his second letter. Perhaps you will kindly oblige me by inserting this letter, a copy of which I send you herewith, in your next issue, as I am afraid, under the circumstances, it will be futile to ask Mr. Usill to do me justice.

Yours faithfully,

June 15, 1885.

H. H. BRIDGMAN.

[COPY.]

42 Poultry, E.C.: June 9, 1885.

Dear Sir,—I beg to acknowledge the receipt of your letter of this date. I have already forwarded a copy of your previous letter to the secretary of the Society of Arts, and, if the Society has any communication to make to me, no doubt I shall hear from them. You say you have no interest in the matter, then why trouble yourself about it? No doubt the two gentlemen referred to are quite capable of taking care of their own interests.—Yours faithfully,

(Signed)

H. H. BRIDGMAN.

G. W. Usill, Esq., Haldon Lodge,  
Southfields, Wandsworth.

#### "A Fortune for a Trifle."

SIR,—Any youth wishing for fame and fortune at one stroke may write to the Corporation of Liverpool for a copy of "instructions for competition for labourers' dwellings as per advertisement." Fifty pounds and twenty-five pounds premium "will be awarded for designs placed first and second. The Corporation reserve the right to withhold either or both of the premiums in the event of the designs not being of sufficient merit. The Corporation do not bind themselves to carry out any of the plans submitted. The Corporation will require the designs (for three blocks of property in Wright, Blenheim, and St. Martin Streets), to be accompanied with a detail description, together with the plans, sections, elevations, specifications, and also an estimate in detail showing the cost of each building or block and probable return thereon (including the land). The gross rental per week must not exceed 1*s.* 3*d.* per room, and the use of all sanitary conveniences."

Now let us see how to go to work:—

|   |              |
|---|--------------|
| One block of buildings, four elevations | = 4 drawings |
| One long and one cross section          | = 2 "        |
| Plan of each floor                      | = 4 "        |
| Sanitary requirements and roof plan     | = 2 "        |

Total . . . 12 "

Number of drawings for one block, or thirty-six drawings for the three blocks.

Say thirty pages of specification, eighty pages of priced

quantities, finished copies and a builder's guarantee estimate, descriptive information and calculations showing gross returns, construction, area value of land per block, and design according to the Corporation by-laws; bill of dilapidations with rents, losses, collection fees, and other items clearly showing the net rental and profit returns.

Then read *The Architect* for May 30, 1885, which says the net return on the Nash Grove dwellings for the poor of Liverpool is 5 per cent. Rentals—one room, 2*s.* 9*d.* per week; two rooms, 4*s.* 3*d.*; three rooms, 5*s.* 3*d.* per week.

Solve this question. Problem:—1st. If the clever engineers and architects engaged by the Corporation of Liverpool (the top joints having over 1,000*l.* per year each) cannot build a single room for a poor man's dwelling for a less rental than 2*s.* 9*d.* per week, to pay 5 per cent. net, can you show them how to build for 1*s.* 3*d.* gross rental per room? 2nd. The youth that can solve this ought to have the next Corporation appointment of 1,000*l.* per year, which will be

"A FORTUNE FOR A TRIFLE."

#### Adisham Church, Kent.

SIR,—I hope you will allow me a small space, not to defend my introduction, or rather I would say my revival, of return-stalls into this church, but to plead for their more common adoption generally, even where they have disappeared. One cannot quarrel with what your correspondent says in speaking of them (page 332). At the same time, one cannot but feel that, quite apart from questions of Mediaevalism or of modern Rome, the return-stall is the most natural and the most expressive arrangement for the leading of congregational worship, from the churchman's point of view. It is no doubt in direct opposition to the tenets of Puritanism. And when the Puritans, at the Savoy Conference, objected to the minister's turning away from people at any part of the service, the bishops replied that it was meet he should turn to the people when speaking to them in addresses or exhortations, but when he was speaking for them, and with them, to God, it was meet he should turn the other way. Until Puritanism appeared this was undoubtedly the practice from the earliest historic times. It is quite possible, as it was customary at Adisham, and probably still is, for the minister to turn towards the people in addressing them, in spite of the return-stalls.

It was, unfortunately, impossible to preserve the old pavement without relaying, but its old declination from the level towards the east was kept as strictly as possible in the chancel as well as nave.

WILLIAM WHITE, F.S.A.

#### CHURCH BUILDING AND RESTORATION.

**Alverstoke.**—The parish church of St. Mary has been reopened after restoration. The work has been carried out by Mr. J. Barton, builder, Ryde, from the designs of Mr. H. Wood-year, architect, of Graffham, Guildford.

**Bournemouth.**—The first portion erected of the new church of St. Stephen has been opened. The architect is Mr. J. L. Pearson, R.A., and the builders are Messrs. E. Abley & Co., of Salisbury. Mr. Athey is clerk of works.

**Stanford.**—The north aisle and porch of St. Deny's Church, in the parish of Stanford in the Vale, Berks, having become very dilapidated, are now being restored under the supervision of Mr. F. H. Barfield, F.S.I., architect and surveyor, of Faringdon, Berks, Messrs. Cadel & Son of that town being the contractors. The new roofs are of oak, timbers and boarding exposed, the aisles being covered with new lead, and the porch with stone slates.

**Birch-in-Rusholme.**—The new church of St. Agnes has been erected from the designs and under the supervision of Mr. Medland Taylor, architect, Manchester. The church will comfortably seat 502 adults. It is built of brick inside and out, the design having been carefully worked out in detail to suit the material. The roofs are covered with Ruabon tiles, with slight patterns of darker tiles. The plan comprises a nave of five bays, the chief entrance porch projecting from the south side of the westernmost bay, and at the west end, centrally placed, is a semi-octagonal baptistery. The church is widened out at its south-eastern part by a double-gabled aisle. On the north-eastern side of the chancel is the site for the organ with the choir vestry behind it, and clergy vestry above that for the choir. The chancel terminates to the east in a semi-hexagonal apse, its westerly bay being pierced north and south by broad arches. The reredos is mainly of cream-coloured stone, with moulded cornice, surmounted by a plain Latin cross. The Lord's Table is raised seven steps above the nave, and the nave floor sloping up about a yard towards the east, a very dignified elevation is obtained without an undue number of steps. A dwarf stone wall bounds the chancel on the west, on the southern portion of which stands the brass Bible lectern,

and on the northern part the pulpit. The font, a bowl of cream-coloured stone with carved cornice, is supported by columns of Devonshire marble with carved caps. There are three lofty baptistery windows. In the centre light is a cross formed in the glazing and surrounded by a narrow line of ruby-coloured glass. There is an inscription in the glazing, and another in a panel below, with terra-cotta mouldings.

**Worcester.**—A new church at Rainbow Hill has been completed and opened. The architect of the building is Mr. Ernest Day, of Worcester. The church consists of nave, 69 feet 6 inches by 25 feet; north and south aisles, 48 feet 4 inches by 9 feet 5 inches; transept, 15 feet 2 inches by 14 feet 5 inches and 11 feet 6 inches respectively; chancel, which is apsidal, 27 feet by 25 feet; vestry and organ chamber, 15 feet 3 inches by 9 feet 5 inches; north and south porches, 6 feet 6 inches by 5 feet, with narthex 12 feet by 6 feet 6 inches at west end having swing doors communicating with porches. Entrances are also provided at the east end of south transept and vestry. The extreme internal length of the church is 108 feet 3 inches by 55 feet 5 inches wide. Extreme heights are as follows:—Chancel, 40 feet; nave, 48 feet; narthex and porch, 15 feet 3 inches; aisles and vestry, 21 feet; transepts, 26 feet. The walls are substantially built with brick varying from about 2 feet to 3 feet in thickness and faced with pressed bricks set in dark mortar finished with a neat cut joint. Bath stone being employed for windows, bell gablet, and outside dressings; also white brick for string and plinth courses. The nave walls are supported on either side with three Early English shafts with chamfered stone arches and moulded labels of grey Bromsgrove stone. On either side the clerestory are six two-light windows, having lancet heads and cusped piercings; over each transept arch is introduced a circular ornamental stone panel. The west end of the church is relieved and lighted by two small single-light windows and a large five-light central window, 21 feet by 12 feet 6 inches, over which is introduced enriched brickwork, a gable ventilator and stone bell gablet springing from moulded stone corbels. The chancel is approached under a handsome stone archway, 20 feet 6 inches wide and 34½ feet high, to apex, which is constructed with moulded grey Bromsgrove stone jambs and arch, the latter having additional moulded stone members springing from moulded and carved caps, with red Round Oak dwarf stone columns on moulded and carved corbels; over this is provided another roof gable ventilator. The chancel has one double-light cusped window and three single-light cusped windows at the eastern end, all having moulded Bromsgrove stone jambs and heads. The walls are relieved by plain and moulded string-courses of Bromsgrove stone and buff brick. The carving and font were executed by Mr. Forsyth. The heating and gas-work was carried out by Messrs. Goodman & Ward. Mr. William Birch has acted as clerk of works. Messrs. Brazier & Weaver, Bromsgrove, were the contractors.

### NEW BUILDINGS.

**Kingstone Bagpuzze.**—New kennels (for fox-hounds) and feeder's cottage have lately been built for the Old Berks Hunt, from plans and under the superintendence of Mr. F. H. Barfield, F.S.I., architect and surveyor, of Faringdon, Berks. The buildings are of brick and slate, and are very complete. The principal floors are laid with "Imperial Stone" paving. The lodging-houses have white glazed brick dados, and are fitted with iron bedsteads. The food is cooked and the water pumped by steam, and special attention has been given to the drainage. A neat iron fencing, with cast-iron coping, is fixed to the yard walls and the grass yard for young hounds. Extensive alterations have also been made to the huntsman's and whip's houses and the stabling near, and the cost of the whole, including boundary walls, new road, &c., has exceeded 2,200*l*.

**London.**—The foundation-stone of the St. James's Temperance Mission Hall, in the Royal Road, Kennington Park, has been laid. The architect, Mr. Banister Fletcher, F.R.I.B.A., presented the silver trowel to Mr. Arthur Pease, M.P. The silver trowel is made from the architect's special design, and has a beautifully chased silver blade with four silver panels, on which is engraved an appropriate quotation from the old dramatist, Beaumont, "Water, nature's ambrosial nectar, welcome!"

**Wardle.**—Two memorial-stones were laid on Saturday last in connection with a Liberal club at Wardle, near Rochdale. The ground floor contains reading-room, committee-room, bar, caretaker's room, lavatory, bath, w.c. On the first floor will be a room, 32 feet 6 inches by 25 feet, which will accommodate two billiard-tables, one smoke and card-room, and a caretaker's bedroom. The walls will be of Yorkshire parpintois, with Halifax dressings. The estimated cost when completed will be about 1,000*l*., but the contract for the building, exclusive of heating, boundary wall, and furnishing is let to Mr. W. R.

Norris for 636*l*.. The works are now being carried out from the designs and under the superintendence of the architect, Mr. Jesse Horsfall, Rochdale and Todmorden.

### GENERAL.

**The City of Paris and "The Architect."**—The authorities of the City of Paris have granted to the proprietors of *The Architect* a special authorisation for reproducing the architectural, pictorial, decorative, and sculptural works of Paris. As these works exemplify the latest developments of French art in architecture, painting, decoration, and sculpture, the importance of the concession will be evident. The plates will be reproduced in the very best style of art illustration.

**The Duke of Hamilton** has bought back for 2,000 guineas *Daniel in the Den of Lions*, by Rubens, for which Mr. Beckett Denison gave 4,900 guineas at the sale of the Hamilton Collection three years ago.

**A Fresco Painting**, supposed to belong to the thirteenth century, and representing the Descent from the Cross, has been found in beginning the work of restoration at St. Peter's Church, Brackley.

**The Plans** of Mr. Alfred Waterhouse, R.A., for restoring Rochdale Town Hall, were considered at the meeting of the Town Council on Monday, and a tender for the work accepted. The total cost of the work is estimated at 14,567*l*., of which 13,600*l*., received from the insurance companies, is in hand.

**Sir Watkin W. Wynn** intends to erect a spacious cottage hospital at Ruabon, in memory of his uncle, the late baronet.

**Plans** for the erection of baths at Goole have been prepared by Messrs. C. E. & C. Tudor.

**Herr Victor Rumpelmayer**, architect, Vienna, died on Monday night in his forty-fifth year. He was the architect of many beautiful palaces. The mansions of the British and German Embassies in Vienna were designed by him. His last work was the design for Prince Alexander of Battenberg's new palace at Sofia.

**Messrs. Haywood Brothers & Eckstein**, of Union Street, Borough, S.E., have supplied the whole of the lights fixed in the new Cobden Hotel, Birmingham (illustrated in *The Architect* last week). The patent semi-prism lenses are very effective in illuminating the large coffee-room in the basement.

**The Preamble** of the Bill for the proposed bascule bridge across the Thames at Tower Hill has been declared proved. The Select Committee have also stated that there should be a regulation that the opening of the bridge should be continuous, whether vessels are passing or not, at or about the time of high water for a specified time, to be fixed by the Thames Conservators, that the land traffic should yield to the water traffic, and that during the construction of the bridge there should be maintained not less than 160 feet fairway.

**The Glasgow Corporation** have instructed the city architect to report as to the practicability of constructing on the ground of the Improvement Trust labourers' dwelling-houses based on rentals not exceeding 1*s*. 3*d*. a room per week; and houses of one, two, or three apartments for artisans, similar to those which had been provided by the Peabody Trustees and others in London and other towns.

**Authority** has been obtained by the Italian Government from the Porte to carry out a series of excavations in Crete. The first work which will be taken in hand will be an attempt to bring to light the walls of the ancient Gortyna.

**A Landowner** has obtained a reduction from the Blean Assessment Committee owing to the encroachments of the sea between Whitstable and Herne Bay, it having been proved that during the last fifty years nine acres of his land had been absorbed by the sea.

**The City Commissioners of Sewers** on Tuesday resolved to contribute 3,500*l*. for the purchase of ground in London Wall, between St. Alphage Church and Philip Lane, to be thrown into the public way. It was also determined to acquire for 2,725*l*. so much of the site of St. Matthew's, Friday Street, as was required to widen the public way there, and to buy for 700*l*. the ground occupied by the portico of St. Paul's School in St. Paul's Churchyard to increase the width of the thoroughfare there.

**A Programme** has been issued by the Sanitary Institute of Great Britain of arrangements for the autumn congress, which will be held at Leicester on September 22 and following days, under the presidency of Professor F. de Chaumont, M.D., F.R.S. The Council invite papers on subjects mentioned in the programme, and will be very glad to receive the personal co-operation and support of all who are interested in the diffusion of sanitary knowledge.

**The Annual Meeting** of the Association of Municipal and Sanitary Engineers and Surveyors will be held in London on Thursday, Friday, and Saturday, the 25th, 26th, and 27th instant.

A Business Supplement

# The Contract Reporter.

to The Architect.

LONDON, JUNE 20, 1885.

## NOTICE TO OUR READERS.

On and after July 3 THE ARCHITECT will be dated on the day of publication, which has always been Friday, although the Paper has been dated on Saturday. This alteration is made to avoid the inconvenience which arises from many of our contributors sending us Tenders and other important information on Friday morning instead of Thursday. All communications intended for insertion in the current number must reach the Office as early as possible on Thursday afternoon. Literary matter should be addressed to the Editor, advertisements to the Publisher, 175 Strand, London, W.C.

## ADVERTISEMENT SCALE.

|                           |        |
|---------------------------|--------|
| For Two Lines and under   | £0 2 6 |
| For every Additional Line | 0 0 6  |
| For Quarter Page          | 2 10 0 |
| For Half Page             | 4 10 0 |
| For a Page                | 8 8 0  |

On pages preceding and following matter, special rates.

Public Companies' Advertisements, 12/ 12s. per page; 1s. per line.

Special arrangement may be made for a series of insertions on application to the Publishers, at the Office, 175 Strand, London, W.C.

## TRADE NOTES.

MESSRS. MORRISON BROS., of Buchanan Street, Glasgow, have just introduced to the public an excellent drawing ink. The ink is thoroughly indelible, of excellent colour, and flows freely from the instrument. We recommend it with confidence.

WE learn that the walnut fittings in the Council-room of the International Inventions Exhibition were provided and fixed by Messrs. W. H. Lascelles & Co., of 121 Bunhill Row.

A NEW carved pulpit of Caen stone has been executed for Norton Canes Church, near Canock, by Messrs. Jones & Willis, of Birmingham and London.

UPWARDS of 10,000 yards of Lincrusta-Walton have been used at the Hôtel Métropole—the bulk of it in the corridors and bedroom dados with pattern No. 61, while pattern 294 has been used as a deep frieze in the Second Salle with good effect. A large quantity of this beautiful decorative material has been used in Spiers & Pond's exhibition dining-room at the Inventions Exhibition, the whole of which is decorated with Lincrusta. The new Arabian dado, No. 151, with border No. 164, and the new Renaissance fitting (294) have been used. These patterns and their treatment have been

very greatly admired. It is also used in the Marquis of Hamilton's room at the Exhibition, and a room in "Old London," with the new panel dado, No. 165, in stained wood effect, and other Lincrusta decorations, has attracted great attention.

MESSRS. DIESPEKER & Co., of 40 Holborn Viaduct, have just laid a marble mosaic in front of the altar of "Our Lady" at the oratory at Brompton. The marbles used are of very fine quality and colour, and together with the excellent workmanship will make this mosaic one of the chief ornaments of the cathedral.

THE handsome marble work at the Hôtel Métropole has been carried out by Messrs. Burke & Co. The work comprises, in entrance hall, dado, having plinth of grand antique; die, of vert maurin, panelled with campan vert; and capping, grand antique. In balustrade, plinth and capping, grand antique; balusters, campan vert. Main columns and pilasters are monoliths of very choice selected grand antique of the Pyrenees. Small pilasters supporting arches, jaune fleuri; string and arches, pavonazzi; caps and bases, gilded; and cornice, Derbyshire alabaster. In the staircase the steps and landings are in vein marble, and the wall decorations as follows:—Plinth, grand antique; die, joinville with styles and rails of vert maurin; capping, grand antique; alabaster above dado; and doorways and window linings, grand antique. The dado in Grand Salle has plinth of grand antique, die of sarrancolin, with styles and rails of vert maurin; capping, grand antique; pedestals of columns are similarly treated; main pilasters supporting archivolts, campan vert; caps and bases, gilded; window linings, pavonazzi. The principal pavements on the ground floor and basement are in marble mosaic.

THE Church of St. Vedast, Foster Lane, will shortly be enriched by the erection of a series of stained-glass windows, now in course of completion in the studios of Messrs. Heaton, Butler & Bayne, Garrick Street, W.C. They are designed in the style of the Renaissance, and great care has been taken that they should thoroughly harmonise with the architectural features of this noble church. On the north side is an arcade of four large windows: these will illustrate the history of the Passion of our Lord. Each window is divided into two compartments: in the upper or chief division are portrayed the events of the sacred history, while below, in smaller panels, are their relative types. The Betrayal is the subject that has been selected for the first window, the subject panel below being Joseph sold by his brethren. In the next window the principal subject is that of our Lord bearing His Cross. The type of this in the lower compartment represents Isaac bearing the wood as he ascends Mount Moriah. This window is the gift of the Saddlers' Company. In the third window the chief subject is the Crucifixion. The type depicted in this instance is the uplifting of the brazen serpent. The last of this series is the subject of St. Peter and St. John at the Sepulchre. Below is the subject of

the dead man raised at the tomb of Elisha. Immediately above the foregoing are four smaller lights, containing emblems of our Saviour's Passion—one in each window—held by angels, the emblems chosen being the Crown of Thorns, the Scapegoat, the Holy Lamb, and the Martyrs' Palms. The effect of the windows will be particularly striking from the richness of the colouring; but due regard has been given to the necessity of a fair proportion of white glass for the admission of light. This has, however, been used so judiciously as to in no way detract from the beauty of effect, but rather to give a breadth and dignity to the general treatment. It is contemplated to fill the window over the font with the subject of the Baptism of Our Lord in the upper or principal panel, and Christ blessing little children in the lower compartment. The windows are being executed under the supervision of Mr. A. W. Blomfield, M.A.

## COMPETITIONS OPEN.

BOURNEMOUTH.—Aug. 19.—Designs are invited for the Construction of Two Marine Piers. Mr. G. R. Andrews, Town Surveyor, Bournemouth.

BRISTOL.—July 20.—Designs are invited for the Erection of Board Schools, Castle Green, for 1,000 children. Mr. Benjamin Wilson, Clerk to the School Board, Guildhall, Bristol.

NORTHFLEET.—June 23.—Plans are invited for the Erection of Schools to accommodate 200 Boys, 150 Girls, and 150 Infants. Mr. Fred. Mitchell, 49 Windmill Street, Gravesend.

LIVERPOOL.—Aug. 1.—Designs are invited for the Erection of Dwellings for the Labouring Classes. Mr. G. J. Atkinson, Town Clerk, Municipal Offices, Liverpool.

## CONTRACTS OPEN.

ABERCARN.—June 20.—For Erection of Shop and Two Dwelling-houses. Mr. David Davies, Architect, Club Chambers, Pontypool.

ACCRINGTON.—For Rebuilding No. 6 Peel Street. Mr. H. Ross, Architect, 5 Birch Street, Accrington.

ARMAGH.—June 27.—For Building Manse and Offices, for the First Presbyterian Congregation. Mr. J. H. Fullerton, Architect, Armagh. Quantities by Mr. E. N. Banks, C.E., Chichester Street, Belfast.

BALLYCULLEN.—June 20.—For Building Dwelling-house. Mr. Charles Burton, Carrow-colman, Eglisli, Dungannon.

BARNSELY.—June 24.—For Building Shop. Messrs. Wade & Turner, Architects, 10 Pitt Street, Barnsley.

BECKENHAM.—June 29.—For Construction of Seventeen Automatic Flushing Tanks and 4,000 feet of Pipe Sewer. Mr. G. B. Carlton, C.E., Surveyor to the Board, Beckenham.

BILBAO.—June 26.—For Building Theatre. Messrs. Yeves & Co., 24 Fenchurch Street, E.C.

**BELFAST.**—July 1.—For Erection of Mission Hall. Mr. Henry Seaver, B.E., Architect, 35 Royal Avenue, Belfast.

**BIRMINGHAM.**—June 25.—For Laying Single Line of Tramway (three and a half miles). Mr. Till, Borough Surveyor, Council House, Birmingham.

**BLACKBURN.**—June 20.—For 21-inch Flange Jointed Iron Pipes (600 yards). Mr. J. B. M'Callum, Borough Engineer, Municipal Offices, Blackburn.

**BLACKPOOL.**—June 24.—For Building Engine Shed. Plans at the Engineer's Office, Hunt's Bank, Manchester.

**BOGNOR.**—June 20.—For Building Assembly Hall, &c. Mr. Arthur Smith, Architect, Aston House, Bognor.

**BURSLEM.**—June 29.—For Building an Earthenware Manufactory. Mr. A. R. Wood, Architect, Tunstall.

**BURY.**—June 20.—For Building Boys' School and Additions to St. Thomas's Schools. Mr. J. Williams, 3 Wilson Street, Bury.

**CANTERBURY.**—June 22.—For Construction of Cement Concrete Gasholder Tank. Mr. H. E. Jones, C.E., Gasworks, Harford Street, Stepney, E.

**CANTERBURY.**—July 2.—For Building Wesleyan Methodist College. Mr. C. Bell, Architect, 9 New Broad Street, E.C.

**CARDIFF.**—June 25.—For Building Vestry Hall and Parochial Offices. Mr. W. F. Gillett, Architect, 34 Charles Street, Cardiff.

**CARDIFF.**—June 22.—For Partial Restoration of Parish Church, St. John the Baptist. Mr. John Prichard, Diocesan Architect, Llandaff.

**CARDIFF.**—July 1.—For Laying 30 miles of Cast-iron Main Pipes of 29 and 24 inches diameter, together with the Construction and Erection of certain Bridges and Subways over and under Railways, Canals, and Rivers, for the reception of the Pipes, and other Works. Mr. J. A. B. Williams, C.E., Cardiff.

**CARLISLE.**—June 30.—For Supply of Iron-work and Special Castings during Twelve

Months. Mr. J. Hepworth, Engineer, Gasworks, Carlisle.

**CARLISLE.**—June 24.—For Reconstructing and Refixing Nave Seats, St. Cuthbert's Church. Mr. C. J. Ferguson, Architect, 50 English Street, Carlisle.

# R. ADAMS,

17 BLACKMAN STREET & 7 GREAT DOVER STREET, LONDON, S.E.,  
INVENTOR and PATENTEE of the  
SAFETY WINDOW WITH REVERSIBLE SASHES

FOR

## INEXPENSIVE & PERPETUAL CLEANLINESS

Which has gained at the INTERNATIONAL HEALTH and  
SANITARY EXHIBITIONS

2 Gold, 4 Silver, and 4 Bronze Medals,  
and 16 Diplomas of Merit.

The fearful sacrifice yearly of Life and Limb of persons in cleaning windows through sitting or standing outside whilst so engaged is most appalling. This can now be entirely prevented. The Patentee, having given this subject the most exhaustive study, is now prepared to supply his patent fittings suitable both for old and new windows at prices to meet the means of all. These improvements are protected by several patents, by each of which the outside of each sash can be reversed for cleaning, and under this new system that duty is rendered a pleasure, whilst the danger, risk, and tremendous responsibility of moral and statute law is removed.

These patent fittings can be procured from 5s. for each sash, and all builders have the right conferred upon them to fit the same in the purchase thereof, and that all shall have the benefit of this national boon, special Agencies are being established throughout the United Kingdom. None but practical and responsible firms are appointed. Such firms are invited to apply for unrepresented districts at once, as it is desirable to complete the list as soon as possible.

The present representatives are:—

# RENDLE'S "ACME" GLAZING

(REGD)

Patentees:—**W. E. RENDLE & CO.,**  
3 WESTMINSTER CHAMBERS, VICTORIA STREET, LONDON.

TO  
ARCHITECTS, BUILDERS,  
AND  
CONTRACTORS.

## STEEL CUT NAILS!!

The modern and important discovery in the process of making Steel has so reduced the price, that Steel Cut Nails of the well-known "Mitre Brand" can now be supplied at only 1s. 6d. per cwt. more than the price of the ordinary Common Iron Cut Nails.

The Steel Cut Nails are far superior in quality and more uniform in size than any wrought or hand-made Nails yet produced, and being lighter in weight than ordinary Iron Cut Nails and free from waters, they are found cheaper in actual use than common Iron Cut Nails at 1s. 6d. p. r cwt. less.

These Steel Cut Nails are specially suited for Builders, Joiners, Coopers, Paving-Case Makers, &c., and a single trial is sufficient to convince any one of their superior quality and cheapness.

**PATENT WROUGHT STEEL NAILS.**  
**OVAL WIRE NAILS.**

Ask your Factor or Ironmonger for  
"MITRE NAILS."

WHOLESALE AND EXPORT ONLY.  
FIRST-CLASS CERTIFICATE AND SILVER MEDAL  
AT CALCUTTA EXHIBITION.

**SAND. SAND.**  
BEST AND CHEAPEST FOR BUILDERS' PURPOSES.  
Guaranteed Sharp and Clean.

For sample, price, railway and canal rates, apply to  
**E. J. BISHOP & SONS, Sand Pits, Leighton Buzzard.**

## COPYING TRACINGS BY LIGHT.

WHITE LINES ON BLUE GROUND.  
BLACK LINES ON WHITE GROUND.

Prospectus sent on application.  
Sensitized Paper for both processes of very superior quality.  
Tracing Cloth and Tracing Paper specially suited for these processes.

**GEO. J. POORE & CO.,**  
MANUFACTURING STATIONERS, 42 CASTLE STREET,  
LIVERPOOL.

## G. & T. EARLE, HULL.

MANUFACTURERS OF LIGHT, DARK AND PORTLAND CEMENTS,  
LIAS LIME AND MASTIC,  
PLASTER PARIAN, KEEN'S PARIS WHITE, HAIR LATHS, ETC.

EARLE'S PORTLAND CEMENT is the best adopted for stucco work, and for use in sewage works and the construction of Gas Holder Tanks.

EARLE'S LIGHT ROMAN CEMENT sets very rapidly, and is especially useful in cases where the sea or a tidal river has to be contended with.

**QUANTITIES, ETC.**  
Correctly Written and  
Lithographed by return of post  
certain.

**J. L. ALLDAY,**  
Shakespeare Steam Printing  
Works,  
COLMORE ROW,  
BIRMINGHAM.

Cream, Fumigators, &c., &c.

AS SUPPLIED TO 600 PUBLIC HEALTH  
BODIES.

The Sanitas Co., Limited, Bethnal Green, E.

# GRUNDY'S PATENT WARM-AIR VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent  
consist in the heating surface being greater than any  
other Fire-grate introduced to the public. It is very  
simple in construction, and is made in the form of a Stove,  
the back of which is semicircular in shape, with gills  
behind and smoke-nozzle on top, all cast in one piece.  
The same can be attached to any design of a Register or  
Stove front. It is very suitable for schools, class-rooms,  
waiting-rooms, hospitals, offices, dormitories, and dwelling-  
houses, from the cottage to the mansion. Design and  
specification post free on application.

## TESTIMONIALS.

"9 Victoria Chambers, Westminster, S.W."

"June 10, 1884.

"Sir,—I have much pleasure in testifying to the  
efficiency of your patent Warm-Air Fire Grate. It has  
been very successful, and given every satisfaction where I  
have used it. Yours, &c."

"To Mr. Grundy. JAMES WEIR, F.R.I.B.A."

"Baptist Chapel, Clapham Common, London. Richard  
Webb, Pastor, 10 Grafton Square."

"February 15, 1884.

"DEAR MR. GRUNDY,—I have pleasure in testifying to the  
excellency and efficiency of your patent Fire-Grate. It is  
the most charming invention for heating a large room I  
have ever known. I shall have pleasure in showing it to  
anyone who wish to have their schools or rooms pleasantly  
and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool,  
July 1884.

"DEAR SIR,—I have very great pleasure in stating that  
the first stove, or patent warm-air ventilating fire grate,  
adopted by me in school at Seaton, and a second in a  
Cocoa Palace, have given such satisfaction that I now  
order eleven to be inserted in New Upper Grade Schools in  
course of erection at West Hartlepool. They are the most  
economical, efficient, and easily managed stove at present  
before the public."

"Mr. John Grundy."  
From Hon. and Rev. G. G. C. Talbot, M.A., Withington  
Cheltenham.

"DEAR SIR,—You will be gratified to hear that the school  
is completely warmed by your new grate. It is the most  
economical and efficient that I have ever seen."

"Mr. John Grundy."  
From F. J. Yates, Esq., Architect, Birmingham.  
"The best of the kind I have seen. I shall have pleasure  
in securing their adoption whenever opportunity offers."

Apply to JOHN GRUNDY, 30 Duncan Terrace, City  
Road, London.

**NOTICE OF REMOVAL.****BELLMAN'S PATENT GULLY.**

This Gully possesses the following advantages:—

Receives and disconnects one Rain-water Pipe and Three Waste Pipes.

Avoids all Splashing.

Ventilates the Pipes and Trap.

Forms Drain for Area or Surface.

Is easy of Access for Clearance.

The ordinary P or S trap to be used in connection with Gully being in a separate piece, can be placed at any angle to meet the drain exactly, thus insuring a perfect joint, the Gully being fixed at right angles. This is a great advantage over other arrangements made with the trap in one piece.

The Holes for Rain-water Pipes are made both Circular and Square and of various sizes.

DESCRIPTIVE CIRCULAR ON APPLICATION.

THIS GULLY IS HIGHLY RECOMMENDED by Authorities on Sanitary Matters.

PRICE AT DEPOT:—EDWARD ST., DORSET SQUARE, N.W., 8s. 6d. each.

Also SINGLE GULLIES, for Sink Wastes only, price 3/9 each.

**BELLMAN & IVEY,**  
(OFFICE ONLY) 37 PICCADILLY, LONDON, W.

# THE GREAT PROBLEM OF THE XIX<sup>TH</sup> CENTURY.

# VENTILATION

## WITHOUT DRAUGHT SOLVED.

The hitherto unsolved problem of "Ventilation Without Draught" is to be seen practically illustrated at FREDERICK HENRY SMITH'S Test Room, No. 68, 52 Queen Victoria Street, E.C., Patentee of the Automatic Siphonic Aspirator System of Ventilation. A personal inspection invited.

*Extract from the Annual Report of the "French Hospital and Dispensary," issued 29th January, 1885.*

We have also to return our best thanks to Mr. Smith, who undertook gratuitously to repaint one of our wards and to apply a new system of ventilation of his own invention, which was very successful.

*Letter from David Urquhart, Assistant Engineer to Colonel Sir Francis Bolton, C.E.*

F. H. SMITH, ESQ., 52 QUEEN VICTORIA STREET, E.C.

4 THE SANCTUARY, S.W., LONDON: NOVEMBER 22nd, 1884.

In reply to your inquiry, I have much pleasure in certifying that your system of ventilation as applied to the "Island Room" of the illuminated fountains at the Health Exhibition reduced the temperature during the displays from about 110 deg. to about 70 deg., and thus enabled the men to perform their duties without inconvenience.—Yours faithfully,

DAVID URQUHART.

*Extract from the TIMES of March 14, 1885, page 7.*

"VENTILATION WITHOUT DRAUGHT.—This desideratum appears to be accomplished by a syphonic system devised by Mr. Frederick H. Smith, at whose offices, 52 Queen Victoria Street, London, we recently inspected the arrangement. The air supply is conducted into the apartment from the external atmosphere by means of air ducts, which terminate in distributing passages at the floor level. The exit for the vitiated air is placed in the ceiling, and consists of two tubes, a large and a small one, running parallel to each other between the floor joists in the case of rooms having others over them. In the case of rooms on top floors, or those having the roof directly over the ceiling, the tubes are placed concentrically, but the action and results are the same. The larger of the two tubes carries off the vitiated air, while the smaller one forms an induction tube for cold air, its outer extremity being open to the atmosphere. These two tubes or conduits are so connected that the passage of the heated air through the larger tube induces a current of cold air through the smaller one in a continuous stream. The result is a rapid clearing away of all deleterious gases and products of combustion as they accumulate, and the preservation of a pure atmosphere at an equable temperature in the apartment. In a small room at Mr. Smith's offices in which five large gas-jets were burning, the atmosphere was apparently quite innocuous at the level of about 7 feet, the temperature being about 60 deg. Fahr. At a higher level, however, and especially near to the ceiling, the temperature was high and the air greatly vitiated. It was demonstrated that this vitiated air was being drawn off through the exit tube, which acted as a powerful sucker. After turning off the gas-burners, and upon the temperature of the room generally becoming lowered and equalised, a feeble upward action was still maintained in the upcast tube, but there was no down-draught whatever. The system has already been applied to a church and other buildings with acknowledged success."

**STOURBRIDGE—continued.**

For Construction and Maintenance for Six Months of 6,859 yards of 9-inch and 12-inch Earthenware Pipe Sewers, Manholes, Lampholes, Flushing-chambers, and other works, Stourbridge. Mr. W. FIDDIAN, Surveyor.

## AN HISTORICAL LUTE.

AMONGST the recent additions to the Historic Loan Collection is Queen Elizabeth's lute (lent by Lord Tollemache of Helmingham), which was left by the Queen, in 1584, at Helmingham Hall, Suffolk, where it has been preserved until the present day. The lute is in an exceptionally fine condition, and bears the maker's name, "Joannes Rosa Londini Fecit. In Bridwell, the 27th of July, 1580." An extremely valuable collection of early manuscripts has also been received from the Stiftsbibliothek of St. Gall, including the celebrated copy of Notker's German translation of the Psalms, and the Antiphoner traditionally said to have been brought from Rome to St. Gall in the eighth century. Collections of portraits in oil have been received from the Royal Society of Musicians and the Bodleian Library. The decorated spinet made for Queen Christina is lent by Lord de Lisle; and autograph letters of Mendelssohn, Franz, &c., Beethoven's will, and many other valuable manuscripts have also been added to the collection.

## HOSPITAL CONSTRUCTION.

At the monthly meeting of the North-Western Association of Medical Officers of Health in Manchester, Mr. Lawrence Booth, architect, read a paper on the construction of hospitals for infectious cases, which he illustrated by the drawings of the infectious hospital, of which he is the architect, now being erected for the county justices at Whittingham. The hospital is being built on the pavilion system of isolation. The pavilions are one storey high, and are completely cut off from the administrative block. The windows are so placed as to secure cross ventilation without exposing the patients to a draught, and an arrangement is provided for the escape of emanations through the roof. The wards are to be warmed by open fireplaces. The sewage is minimised by the introduction of earth closets, and the drainage from the roof is entirely distinct from that of the sewers. The

corridor floors are to be formed of concrete, with glazed tiles at the surface, pitch pine being laid in the wards. The dimensions of the wards allow 1,400 cubic feet of air to each patient.

## DARTMOUTH WATER SUPPLY.

THE works for increasing the water supply of Dartmouth are now completed, and the new reservoir, which is situated in the Ford Valley near the town, has been formally opened in the presence of the Mayor and Corporation.

The increased supply is intended chiefly for the southern portion of the town, which was imperfectly supplied before. The works were carried out from the designs and under the superintendence of Mr. E. H. Back, C.E., the borough surveyor, the contractor being Mr. James Hawkins, of Dawlish.

## THE A B C PROCESS.

DR. C. MEYMOTT TIDY and Professor Dewar have made a report, after a lengthened and exhaustive examination of the A B C Process at Aylesbury, for the purpose of determining its efficiency. The conclusions they arrive at are as follows:—

That the A B C Process produces a clear effluent, free from suspended matter and devoid of smell; that the effluent is uniform, notwithstanding the very varied nature and concentration of the sewage; that as the strength of the sewage increases, the precipitation is more complete; that the Process removes over 80 per cent. of the total oxidisable organic matter; that it precipitates 60 per cent. of the organic matter in solution, and of the residue left in the effluent at least two-thirds are non-albuminous, and, therefore, of a nature less liable to putrefactive and other changes; that the process is carried on without nuisance, the sewage being immediately and completely deodorised, and the entire works free from any objectionable smell; and that it produces a manure containing an average of 3·8 per cent. of ammonia

calculated on the perfectly dry manure, or if with 20 per cent. of water, 3 per cent. of available ammonia, and also 5 per cent. of phosphates reckoned as tricalcic phosphate of lime.

## SOFT WATER AND LEADEN PIPES.

A CORRESPONDENT under the signature of "Country House" writes from the Athenæum Club as follows:—"I have some extremely soft water which I require to be conveyed by gravitation a distance of half a mile, and laid on my house. It is injuriously affected by lead, and I should be glad to know what is the cheapest, safest, and most lasting material for a pipe in which to convey it. The water is required both for drinking and general purposes."

[The lead-encased, block-tin pipes of Messrs. Henry Gardner & Co., of Bridgewater Street, Liverpool, would meet the circumstances of the case.—ED.]

## IRON TRADE IN SPAIN.

THE Spanish ironfounders and manufacturers have of late years been making considerable progress. They have good machinery, rich minerals, and coal. They have consequently no need for the high duties at present imposed upon foreign iron manufactures. Tools and hardware, including locks and screws, are supplied chiefly, so far as the better qualities are concerned, by England, the commoner descriptions coming from Germany and France. Recently, however, these have begun to be drawn from the United States. Wrought iron for building purposes, so far as it is derived from abroad, is received from Belgium, and the use of iron for this purpose is increasing, architects preferring it to wood. It is, however, becoming increasingly difficult for Belgian producers to compete with those of Spain, the latter having recently reduced their prices considerably. In iron castings for columns, pipes, and gratings, foreign producers find it quite impossible to compete with Spanish foundries.

## THE "HARDING" VENTILATING COMPANY,

30 EAST PARADE, LEEDS.

HARDINGS' PATENT AIR DIFFUSER  
FOR VENTILATING ALL KINDS OF BUILDINGS.

Mr. T. PRIDGIN TEALE, F.R.C.S., M.A., Surgeon to the General Infirmary at Leeds, says of Hardings' Diffuser in his book called "Dangers to Health":—"I am satisfied that by means of this apparatus, we can secure in a town freshness of atmosphere, absence of draught, and exclusion of dirt."

The fresh air is conducted through a grate and aperture in the wall, as shown on section, about 7 feet 6 inches above the floor level; it is then conveyed through the filter, and passed into the room through a series of small tubes placed at an angle of about 30 deg. with the wall.

By these means the currents of air rushing into the apartment are compressed whilst passing through the tubes. The currents of air, as soon as liberated, expand, cut into, and break each other up, and diffuse in all directions so effectually that no draught or chilly sensation can possibly be experienced by the occupants, and at the same time a large volume of pure air is constantly being admitted and dispensed evenly through the apartments.

## CHURCH WALL VENTILATOR.—As used in the ventilation of Archbishop Zouche's Chapel, York Minster.

The DEAN OF YORK, with reference to the ventilating of Archbishop Zouche's Chapel at York Minster, says:—"I think the ventilation is perfectly successful, and all I have spoken to about it are well satisfied with it, and much pleased with the result."

OUR PATENT EXTRACTOR is the best in the Market, and is supplied at a very much lower price than any other.

CHURCH WINDOW VENTILATOR.—These Ventilators are used for Churches, Chapels, and other Public Buildings where it is not desirable to have holes cut through the walls to admit air in the usual manner. The appearance is not more noticeable than the ordinary Hopper Ventilator so frequently seen.

"Armley, Leeds, Oct. 29, 1883.

"GENTLEMEN,—I have pleasure in stating that in my opinion your system of ventilation, introduced in our Church this summer, is a decided success. Heretofore when the Church has been well filled at the Evening Service, I have been almost exhausted by the effort of speaking before I have got half through. On Sunday night, October 7, at our Harvest Thanksgiving, we had a very large congregation, and I preached without the least feeling of weariness or exhaustion. I shall be glad to hear that your Air Diffusers are being widely adopted.—I am, yours truly, JOHN GREGORY, Minister of Oak Road Congregational Church, Leeds."

These Ventilators are more suitable for Schools, Warehouses, and other Buildings where cheapness is an object. The result is precisely the same as in our other styles, at a very much smaller cost.

A reduction in price is made where a number of Diffusers is required.

Estimates and further information given on application to the "HARDING" VENTILATING CO., 30 East Parade, Leeds.

## RAILWAY VIADUCT.

THE directors of the Glasgow and South-Western Railway are about to replace the wooden bridge over the Urr, near to Dalbeattie, on the Castle Douglas line, with a large girder viaduct; and the work has been let to Mr. J. B. A. McKinnel, of the Dumfries Ironworks, the contract price being 15,000*l*. The total length of the viaduct is to be 426 feet, and 825 tons of metal will be employed in its construction. It will be founded on fourteen iron cylinders 8 feet in diameter, and filled with concrete. These will be of an average height of about 20 feet, and above them will be a height of 20 feet of solid masonry, on which the girders will be extended. The rails will be about 33 feet above the ordinary water-level. The old bridge is of sufficient width to carry a double line of rails, and half of it will be retained until the new structure is sufficiently advanced to allow of the traffic being transferred to it.

## GLASGOW BRIDGE.

THE Glasgow Town Council have adopted a report and plans by Messrs. Bell & Miller, engineers, in reference to the widening of Glasgow Bridge. Accompanying the report is a plan showing how they propose to effect the alteration. It is pointed out that a total increase of width of 30 feet would be given to the bridge, making it 88 feet between the parapets, or 4 feet wider than Westminster Bridge, the pavements being each 15 feet and the roadway 58 feet wide. The foundations of the addition on either side would be formed by cast-iron cylinders up to the low-water line, filled up with Portland cement concrete. Upon these would be built the masonry of the piers in the same style as at present, the granite facing of the present piers being moved forward and rebuilt. The arched girders, cornice, and parapet would be of steel and iron. The excavation of the cylinders while sinking would

be done under compressed-air pressure, to prevent any disturbance of the present foundations. The great additional width would remove, to a great extent, the inconvenience arising from the interference of the cross with the through traffic, as there would be so much room to avoid obstruction. With the traffic regulated as it now was, and the foundations protected from any scour which might tend to undermine them, there was nothing to prevent the bridge from serving all the purposes for which it was intended for centuries to come. The beauty of Telford's fine bridge was not interfered with, as the piers would be the same as at present, and all the main outlines were preserved exactly the same. It is estimated that the cost of this improvement would be little over, if at all, the sum of 25,000*l*. received from the Caledonian Railway Company for the purpose of widening the bridge.

## LUMBER TRADE.

THE following particulars are given in the report of Consul Cridland for Mobile:—

This important branch of business, which is one of the leading and growing industries of Mobile and South Alabama, has during the past year held its own, and, notwithstanding the general depression in trade, many shipments have been made to new and important markets, showing as it does that the dealers and exporters who are active and energetic have been alive to any change in the trade, and whenever the demand began to fall off in one direction they did not wait for orders from other places, but sought new and important markets, causing Mobile lumber to become well and favourably known in Europe and many sections of the United States. The trade of the past year, as represented by shipments in vessels, would no doubt have been larger than it was if it had not been for the depressed condition of Northern and Eastern markets, and the stopping, to a great extent, of railroad building in Mexico and Texas. Then, again, the mill men generally prefer to cut sawn timber instead of small

stuff when prices are favourable, which was the case the past year, as a very large business was done in sawn timber—in fact, larger than any previous year. The shipments in 1884 by rail to the interior and Western markets, also North, were very large, and I am informed by dealers that this branch of the lumber trade was larger than in 1883. The total shipment of pitch pine last year to foreign and coast ports from Mobile was about 22,200,000 feet against 26,700,000 feet in 1883, showing a decrease of 4,500,000 feet. The exports of lumber to foreign ports in 1884 show an increase of about 372,000 feet as compared with 1883, which was caused by a very large export of the article to Great Britain, as the total shipment in that direction was larger than one-third of the total exports foreign. The exports to France, Mexico, and Cuba show a heavy decrease, while there was a decided increase in lumber shipments to Germany, Holland, Spain, Trinidad, and Hayti. Large shipments have been made to Belgium, Italy, and Monte Video against none last year.

Although the total shipments foreign exhibit an increase, yet the total value is about 11,650 dols. less than last year, which shows that prices of lumber ruled lower than last season.

## BUILDING IN PORTSMOUTH.

SEVERAL important works are in progress at Portsmouth, including two halls to be built by private companies, and an extensive wharf, to be erected by the Corporation, at an estimated cost of 30,000*l*. The foundation-stone of the latter was laid a few days since by the Mayor (Councillor Moody), who gave a luncheon in honour of the event, the guests at which included Mr. H. P. Foster, of John Street, Adelphi, the quantities surveyor to the Corporation, who, in that capacity, has been connected with the erection of a gaol and lunatic asylum, and the execution of extensive drainage works. As soon as the question of site has been settled, Mr. Foster will take out quantities for a new Town Hall.

**BOYLE'S IMPROVED SELF-ACTING  
AIR-PUMP VENTILATORS.**

MESSRS. ROBERT BOYLE & SON, 64 Holborn Viaduct, and 110 Bothwell Street, Glasgow, have patented an improvement in their well-known Self-acting Air-pump Ventilator, which experiments have fully demonstrated not only adds considerably to the extracting power, but renders the ventilator absolutely waterproof. This improved modification, whilst most ingenious in construction, is simpler in the working parts than the form of the Air-pump ventilator which has hitherto been manufactured, and which will now be withdrawn from the market, being superseded by this the latest improvement. The Messrs. Boyle have, as usual, done their best to meet the requirements of architects by making even the plainest pattern of the improved ventilator ornamental and neat in design, which effectually adds to the appearance of it.

This is decidedly a step in the right direction. We understand that, instead of the price of the improved ventilator being higher, as might have been expected, owing to its being so much more powerful and ornamental, it will be even lower in price than the old form of ventilator, Messrs. Boyle having found such an immense increase in the number of ventilators sold and buildings ventilated owing to the reduction made on previous prices, that they have wisely determined to supply their ventilating appliances at the lowest possible price consistent with efficiency and first-class workmanship, their aim being to bring a really reliable and well-constructed ventilator within the reach of all, so that there need now be no excuse for the defective ventilation of any building on the score of expense, as it will be found, by comparing the price-list of the improved Air-pump ventilator with those of other ventilators, that it is the cheapest of its class in the market.

The accompanying diagrams, figs. 1 and 2, show the elevation and plan of the plainest and cheapest pattern of the improved ventilator. In the plan of the ventilator (fig. 2), A indi-

cates the opening into which the wind passes and impinges upon the deeply-curved bell-mouth arrangement B, in which a large body of air is

FIG. 1.

Registered Design.

collected and forced into the narrow annular space C, at which point, owing to the compres-

sion of the air, which cannot otherwise escape or free itself, it attains a greatly accelerated velocity, and, in passing over the slip D, creates a powerful induced current, exhausting the air with considerable rapidity from the central chamber E. The foul air immediately rushes up the shaft to supply the place of the air extracted, and is in its turn drawn off, thus creating a continuous and powerful upward current in the shaft connected with the apartment being ventilated. F, diaphragm to deflect the air

FIG. 2.

over slip D. G, curved baffle plate or guard to protect the slip opposite, concentrate the current, and prevent it from expanding and being deflected backwards without passing over the slip D. H, space dividing the exit slip from the central chamber, and to receive and run off any water that might find its way in when the ventilator is used on board ship with seas sweeping over it. J, deep lip or rim to prevent any water that might enter the space H from passing into the central chamber and down the shaft. The shaft attached to the ventilator may be made any diameter required, but it should be borne in mind that the extracting power of a properly constructed roof ventilator lies exclusively in the head, and is solely determined by the size of the same. We can safely predict a very large sale for the improved ventilator, and we think that the name of the inventors is a sufficient guarantee that it will really answer the purpose for which it is intended.

# DAMP WALLS.

### BLUNDELL'S PETRIFYING LIQUID

Is a preparation for interior use, for the cure of DAMP WALLS. It is made in two colours, White and Red. It is applied with a brush as easily as ordinary paint, and dries hard in a few hours with a glazed surface. The many uses of such an article are obvious. As an economical substitute for White and Red Glazed Bricks, for interior walls, it is most efficient. Applied over brick, cement, iron, or wood, for the walls of passages, kitchens, schoolrooms, hospitals, and charitable institutions, where **CLEANLINESS** is indispensable, it will be found invaluable, as the smooth enamelled surface offers but little hold for dirt, &c., and can be washed when necessary. Used over walls before papering, it prevents discolouration, and offers a surface to which the paper will adhere firmly. Economical in cost, simple in application, and efficient in use. The proprietors recommend it with full confidence. To be obtained of the leading Paint, Colour, and Varnish Dealers.

NOTABLE EXHIBITS AT THE  
INVENTORIES EXHIBITION.

NOTWITHSTANDING the many new water-waste preventers that have of late years been introduced, including several on the syphon principle, there appears to have been room for improvement judging from the exhibit of Messrs. Humpherson & Co., 331 King's Road, Chelsea, S.W., in the South Gallery, North Court, Stand 222. It will be seen by the appended illustration that it has a well-bottom, which enables the full flush of two

gallons to be secured each time it is set in action, which is not obtained with all the flat-bottomed ones. But it is in the chambers that effect the syphon action that the greatest novelty is seen. These are three in number, the inner one being of stout galvanised iron, and the outer ones forming the rising cap are composed of two and are made of copper. By this mode the air is more securely bound between the cylinders, and the action may be thus described. A small quantity of water

being retained in the well after the cistern has been emptied, the water again entering causes the air, as we have observed, to become securely bound, and prevents the water from passing over the inner cylinder. The lever being raised, a partial vacuum is formed, and the water is forced into it by atmospheric pressure, causing it to overflow the centre pipe, when the contents are discharged by the usual syphon action. In drawing the lever down, its fall is arrested at a certain point, so that it will return to its proper position with ease, which cannot be said of all syphon cisterns worked with a ball-valve, which is the only mechanism connected with this appliance. Another improvement is secured by attaching a long nose to the inlet pipe, which, carried to nearly the bottom, causes the inflow of water to take place without noise. It has a full 1½-inch waterway all through, causing a powerful flush to the last and the cistern to be emptied whether the lever is held down the whole time or not. Owing principally to the large waterway, it is particularly adapted for positions where only a low head of water is accessible, flushing effectually at a height of only two feet. Mr. Humpherson in constructing this cistern appears to us to have had in view the best means of making the most of the orthodox two gallons, which is too small a quantity to properly flush some closets. Why do not London water companies take pattern by some of the provincial ones and allow a larger quantity? There are many provincial towns where water is not at times so plentiful as in the metropolis, and yet the authorities consider it necessary for sanitary purposes to insist on a larger consumption, two and a half and three gallons being commonly used.

Another invention, shown by Messrs. Humpherson, is an improved pipe-joint, invented and patented by them. The object of this is to secure a perfect joint at the junction of the earthenware trap and metal soil pipe. The illustrations will enable the invention to be understood readily, the first one showing the two pipes, and the mode of affixing the "seal," and the other the invention itself, which consists of a grooved or hollow metal ring, open at

one part of its circumference, into which is placed a thick vulcanised indiarubber ring made of the same sectional shape as the ring. The ring being placed over the joint, the metal rim is

added to it, and, being drawn closely together by means of the nut and screw, the indiarubber becomes distended, but the two form one homogeneous whole. We need not descant further upon the advantages of this invention,

as all plumbers know the difficulty of obtaining an hermetically sealed joint under the circumstances we have mentioned, that will remain secure for any length of time. By the use of

this invention, so easily applied, contraction and expansion takes place without breaking the seal in the least, and it will resist any amount of pressure, while accommodating itself to different variations of temperature. We have no doubt its advantages will be readily conceded, and that it will meet with the success it deserves.

### THE HOLLOWAY SANATORIUM.

THIS institution, which has been erected at Virginia Water, and which is intended as a sanatorium for people of the middle class who are suffering from mental infirmities but are not hopelessly deranged, commenced some years since by the late Mr. Thomas Holloway, and completed under the direction of his executors, was formally opened on Monday afternoon by the Prince of Wales.

The Holloway Sanatorium, although erected for the benefit of those who are suffering from mental disorders, is not intended to be devoted to the use of an ordinary asylum for the insane. Amongst the rules is one that no patient should remain an inmate more than a year; another, that no one will be received whose case is considered hopeless, and none will be readmitted after being discharged.

The building in front shows an extended façade of 528 feet, with a projecting structure in the centre, with a square tower 140 feet in height. The building in front has eight bays, is of red brick dressed with Portland stone, and is broken up by lofty crenelated gables, to form separate groups of houses, which are connected. The number of rooms in the building is 480, giving accommodation for 240 patients and servants, though this on a pressure could be extended, for as at present designed the majority of the patients are intended to have separate bedrooms and sitting-rooms. The interior fittings are of finished character. Everywhere there is a preponderance of bright colour. The two principal apartments are the recreation-hall and the refectory. The former is 80 feet in length by 60 in width, with a pitch of roof to 60 feet at

the ridge. On the south it is lighted by seven windows, and on the north side by four. The roof is of the hammer-beam type, all the span-drels being filled with pierced tracery. The windows are of stained glass, and around the walls is a series of paintings, with likenesses of the Queen, the late Prince Consort, the Prince and Princess of Wales, Lord Beaconsfield, Mr. Gladstone, and many notables in history, while at the upper end are full-length portraits of Mr. and Mrs. Holloway, and smaller ones of Mr. Martin-Holloway and Mr. Crossland, the architect. The treatment of the walls is arabesque, hardly a square inch being left uncoloured or ungilt. The flooring is of oak parquet. This is approached from an entrance-hall springing from three richly moulded arches, while the whole surface of the wall is most sumptuously decorated. The dining-hall, a room 54 feet in length and 32 feet broad by 40 feet in height, has the walls covered with Watteau paintings by the students of the Art Training School, under Mr. Poynter, R.A., the general surroundings being of the same gorgeous character as the rest of the building.

The cost of the institution, with fittings and grounds of thirty-four acres, has so far been nearly 300,000*l.* The premiated designs for the building, by Messrs. Crossland, Salamons & Jones, were published in *The Architect*. Messrs. Thomas Lawrence & Son, of Bracknell, Berks, supplied all the red rubbers and bricks.

### FEES FOR PLANS.

MR. GUEST LUCKETT, architect and surveyor, of Aylesbury, sued Mr. C. T. Adams, auctioneer, &c., of Stoke Mandeville, in the Aylesbury County Court, for 1*l.* 10*s.*, for preparing drawings for a schoolmaster's house at Stoke Mandeville. He was asked to perform it, and agreed to, at 2½ per cent. commission on the amount of the contract. Tenders were advertised for, but the work was then abandoned; but the house had since been built from plans by Mr. W. Y. Green. In reply to Judge Whigham, plaintiff said the front of the house was very much like what witness had planned.

Defendant said the school-managers had deputed him to get specifications. He told plaintiff the school was very poor, and the extreme limit of the cost of the building must be 150*l.* When plaintiff's plans were shown to builders they all laughed at the idea of their building the house according to them for the sum named. Plaintiff replied that there was an existing house, for which he allowed 20*l.*, which would raise the amount to 170*l.* Defendant, in reply to the Judge, said he got the house built for 170*l.*

His Honour thought the plaintiff entitled to something for his labour. Defendant replied that if it were his own affair he would give it; but he was acting for the school-managers, and theirs was a very poor parish.

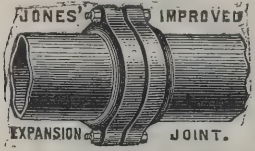

His Honour found for a guinea, and ordered each party to bear his own costs.

### A VERBAL AGREEMENT.

At the Guildhall, Rochester, before Mr. W. P. Haymen and other city justices, Messrs. Kellett & Bentley, of London, engineers, were summoned by John Spearman & Thomas Hulme, joiners, for 6*l.* 14*s.* 10*d.*, balance of 33*l.* 15*s.* 8*d.*, for work done under an agreement. Defendants are the contractors for the erection of the new pier at the Rochester Esplanade, and the complainants undertook to lay the flooring for them at so much per foot. The parties agreed as to measurement, and the complainants admitted that a few more bolts were required in their work, but there was a dispute as to whether or not, under their agreement (a verbal one), complainants ought to plane the flooring. Defendants maintained that they ought to, but complainants held the contrary, and their view seemed the more reasonable, as the amount of planing which might be required in such a case would be a very indefinite quantity, depending entirely on the evenness or otherwise of the timber with which the contractor chose to supply the joiners. The magistrates in the end ordered defendants to pay 6*l.* 4*s.* 10*d.*, and costs 15*s.* 6*d.*, deducting 10*s.* in respect of the bolts admitted to be wanting.

# "THE PEDESTAL VASE," JENNINGS' IMPROVED W.C. APPARATUS

(Combination Urinal and Slop Sink).

Registered No. 16,300.

A PORCELAIN VASE set on a tiled or mosaic floor, within walls or a dado of glazed tiles. The usual wood framing, forming a storehouse for the retention and accumulation of *damp*, *dirt*, and *disease germs*, with the joints, crevices, and imperfections in work which the closet enclosure so often conceals, is entirely abolished. The seat is hinged, permitting free access for use as a *slop sink* or *urinal*, and for cleansing, so that the entire apparatus and space can be freely washed down. For this latter purpose the floor should be slightly sunk, and laid to fall to a grating, with waste carried through the external wall, and terminating in a copper flap valve to prevent draught.

The suggestions as regards wall linings and floor, may, of course, be modified as best adapted to the building in which the closets are used; and in the consideration of such details, alternative schemes will readily present themselves.

At the recent **HEALTH EXHIBITION** (South Kensington, 1884), amongst a series of official tests, under the supervision of Baldwin Latham, Esq., C.E., and the Jury No. 9, Class XXIII., and successfully withstood by this closet, the following may be cited in evidence of its efficient action. Being fixed in position shown in illustration, with "**JENNINGS' PATENT SINGLE FLUSH WASTE-PREVENTING SYPHON CISTERN**" 5 feet over, with  $1\frac{1}{2}$  inch down pipe, ten apples (averaging  $1\frac{1}{2}$  inch diameter) and a flat sponge about  $4\frac{1}{2}$  inch diameter were thrown into the basin. The water, as well as the whole of the exposed or dry surface, was first blackened with plumber's "smudge," and the sides covered by four pieces of thin sanitary paper, which adhered closely to the soiled surface. The handle of the cistern was then pulled, and the two-gallon flush liberated. After seven seconds (the time occupied by the discharge), a receiver placed under the trap outlet was removed, containing in the blackened water the **ten apples, the sponge, and the four pieces of paper**, no traces of the soil remaining visible upon any part of the apparatus.

**GOLD MEDAL AWARDED.**

THESE CLOSETS are already in use in Hospitals, Banks, Hotels, Offices, Private Residences, &c., with most satisfactory results, and, fixed in the manner described, in appearance and action leave nothing to be desired. By the novel arrangement of the supply to Basin, as shown in the sectional sketch annexed, the whole surface is well flushed and cleansed, whilst the bottom of Basin and Trap are thoroughly scoured by a concentrated rush of water which insures the **instantaneous removal** of the contents, thus overcoming the inherent defects in the many imitations recently produced of "**JENNINGS' MONKEY-CLOSET**" (the original form of wash-out watercloset), which was invented and patented by G. J. in 1852.

## THE WEEK.

M. EDOUARD CORROYER, architect of the works at Mont Saint-Michel, has been appointed the successor of the late M. BALLU, as inspector-general of diocesan edifices for that part of France which lies between Sens and Nantes in the north, and the Pyrenees and Mediterranean in the south.

ACCORDING to the return of Mr. APPELL, of the South Kensington Museum, there have issued during the past year 555 English and foreign works or publications relating to fine art, or of a kind that would be useful to art students. The South Kensington Art Library has obtained 454 of them. England stands at the head with 252 works, Germany has 146, France 126, Italy 19, and Sweden with Denmark 12.

BEFORE resigning office, Earl GRANVILLE nominated the members of the International Jury who are to represent England at the Amsterdam Exhibition. They are as follows:—Group 1, Education and Liberal Arts—Mr. E. W. GOSSE and Mr. HENRY SPICER; group 2, Furniture, &c.—Mr. J. S. TEMPLETON and Mr. T. C. MOORE; group 3, Textiles—Sir JOSEPH LEE and Mr. HENRY LEE; group 4, Minerals—Mr. BAUERMAN, Mr. GRIMSHAW, and Mr. W. J. BUSH; group 5, Mechanics—Captain DOUGLAS GALTON and Mr. W. ANDERSON; group 6, Food—Mr. WALTER LOW; group 7, Navigation—Mr. H. DUNLOP; group 9, Commerce—Mr. BATEMAN; section 4, Electricity—Captain ABNEY and Mr. W. H. PREECE.

AN official report on the exhibition which was held last year at Nice states that so far from proving an attraction to strangers, as had been hoped, it had on the contrary a deterrent effect. People do not come to Nice to visit international exhibitions, or to encounter crowds of sightseers, and the expectation that a rise in prices would ensue kept many away. The exhibition itself, though not especially remarkable, was rich in pottery ware of Vallauris and Mentone, and in Paris furniture and carriages. In the English section, Messrs. DOULTON exhibited a trophy of their ware as well as sanitary appliances, which were much appreciated and studied by the natives. In the gardens were pavilions containing the exhibits of the several municipalities of Nice, Cannes, Grasse, and Mentone, that of Nice being by far the most interesting for its collection of ancient inscriptions and prehistoric remains. Financially the exhibition was a failure. A sum of about 300,000 frs. was subscribed by the town, and as much or more by Monte Carlo, while 500,000 frs. was raised by means of shares. The letting of space to exhibitors, &c., probably raised the amount to 2,000,000 frs., while the total amount laid out is said to have exceeded 5,000,000 frs.; hence a lottery to the amount of 4,000,000 frs. has had to be resorted to to cover expenditure which is not yet drawn. Many of the small exhibitors failed to dispose of their wares, and were half ruined.

THERE are cases enough to show how little risk is incurred in slandering an architect; but when he holds a public office he has a chance of being placed on a footing with his fellow-citizens, and securing the protection of the law. The *John O'Groat Journal* in October last followed the example of many of its southern contemporaries, and edified the natives of the extreme north by publishing a letter, signed "Nemesis," which stated that Mr. BRIMS, an architect and Dean of Guild at Wick, was a dishonest person, who had prostituted his municipal appointment so as to benefit himself at the expense of the town of Wick; that he had dishonestly spent or caused to be spent public money, so as to improve and enhance in value the property belonging to himself as an individual, and so on. Mr. BRIMS took an action, and the defendants, among other pleas, said the statements were true, or were currently reported and believed by them to be absolutely true. The jury,

however, took a different view of the case, and on Tuesday last returned a verdict for Mr. BRIMS with 120*l.* damages. "Nemesis," like MINERVA at Troy, apparently gave support in order that punishment might come with more certainty.

The Porte Saint-Denis in Paris is completely surrounded with scaffolding of so elaborate a kind that it hardly seems to be intended for temporary use. But the work of restoration will occupy three years at least. The hoardings have been let for advertisements on the understanding that the space is available for that period. The area that can be covered with announcements is about 1,200 mètres.

A RELIQUARY of great antiquity and interest has been discovered in removing the surface stonework in the north wall of the sanctuary of the parish church of Folkestone. It evidently contains the remains of St. EAUSWIDE, or EAUSWITH, as she is now called, the patron saint of Folkestone, to whom the parish church is now dedicated. The reliquary is of lead, 15 inches in length by 12 inches in height and the same in width, and curiously marked with a zigzag pattern. Immediately above the place in the wall where it was inserted is a niche, where there has evidently been a shrine. The reliquary contains the skull and many of the bones in a fair state of preservation. It has evidently been opened and roughly treated, probably at the time of the Reformation, and then reinserted and built into the wall, and so covered as to have left no external mark of its whereabouts.

A DECISION which has been given in the Queen's Bench by Lord COLERIDGE and Mr. Justice MATHEW, gives a wide interpretation to the word "minerals," which so often occurs in conveyances. The Crown happens to be lord of the manor in Carnarvonshire, and has a claim on "all mines, minerals, ores, coal, limestone, and slate." The ordinary meaning attached to such words is that they refer to inorganic matter that is only obtainable at more or less depth below the ground. In one place, which was a piece of mountain land, the parishioners had rights of common, and sheep were allowed to graze on the short grass which grew on the granite. The granite had been also used to repair roads. But of late a company had endeavoured to turn the stone to better account as a building material, and had arranged with some of the parishioners for their rights. The Crown intervened, and the Court has given judgment. According to the decision, as there is nothing but granite in the place, unless granite is meant by minerals, there is nothing reserved, and the whole of the property would be given away without any consideration. Hereafter it will follow that "minerals" can be taken to mean the rocky stratum which, in course of time, is transformed into soil by atmospheric and other action, and in consequence more care than usual must be taken when drawing conveyances in which reservations are necessary.

THE changes in the nomenclature of the Paris streets are likely to be puzzling to a visitor. No street in the city was better known than the Rue Bonaparte, leading from the Quais to the Rue Vaugirard, for in it is the entrance to the Ecole des Beaux-Arts, and it is also a sort of Paternoster Row, as publishers of books on art and engravings have taken up their quarters there. Henceforth it is to bear the title of the Rue de Luxembourg. It is rather misleading as an indication of contiguity or direction, although less so than a similar title used to be when it was found on the street leading out of the Rue de Rivoli, and which is now known as the Rue Cambon. The Rue Bonaparte was constituted in 1852 by the unification of three separate streets. If an alteration must be made, one of those old names might be adopted, and so call the street Rue St.-Germain-des-Prés. But why not take a cue from the bust at the School, and call the street Rue Philibert de Lorme? Another change is the substitution of "Boulevard de la Convention" for "Boulevard Haussmann." It is to be hoped that the new title will be a sign of the approaching completion of the thoroughfare. Among the names which have been adopted for streets are those of BASTIEN LEPAGE and GUSTAVE DORÉ. The English philosophers CAVENDISH and PRIESTLY are also to be commemorated.

## A YEAR'S WORK OF THE SCIENCE AND ART DEPARTMENT.

THE importance of a Government office in this country is tested by a cash standard, and expenditure rather than utility determines its position. As the cost of the Science and Art Department for the year 1884-85 has been only 371,611*l.* 12*s.* 10*d.*, it would be vain to say that the work which has been executed can have the interest for the public which belongs to other departments of the State in which the outlay is to be counted by millions. The necessity for a national system of education in art and science is not yet self-evident in England, and the average taxpayer finds little comfort for himself should he chance to hear that 851,805 persons are being taught drawing, painting, or modelling through the agency of South Kensington, and that 78,336 students are attempting to cope with scientific difficulties. The statistical diagrams which indicate the growth of the schools by means of curves that run from the foot to the top of the page testify also to an ascent of altitudes in cost (although one may not correspond with its concurrent), and it is the latter—the black financial curve—which is certain to perplex our taxpayer.

The authorities of the Department naturally make the best of what they are doing, but in no other Government reports is so much to be found to suggest what has not been done. Publicity is a principle of the museum, and if a blunder has been made in a purchase, or if a false step has been taken, the country is not left in the dark. There are too many checks to allow of the suppression of defects. If South Kensington is the best abused of all the Government departments, it is owing, in a great measure, to that constant divulgence of information which HENRY COLE initiated.

We have lately called attention to the shortcomings of the Department teaching which were exposed before the Commission on Technical Education. In the reports of the science classes, where the tests are necessarily of a more precise kind than they can be for art, we can see a confirmation of what was then said. It is only here and there that we find evidence to suggest that the students are forming a more worthy notion of what they have to do, and that they will not allow themselves to be coached or crammed for the benefit of the teachers. Professor HUXLEY, who has shown himself to be hard to please, thinks that in his section "on the whole there is an improvement, inasmuch as gross blunders are fewer;" but he again condemns the drilling of a number of students in the hope that some of them may pass. In another section the cause of the failures is debited to the teachers. "The defective results," the examiners say, "cannot be ascribed to the want of intelligence in the candidates, but is due to shortcomings in the teaching. In fact, our results point to the conclusion that where want of intelligence is exhibited the cause must be sought, not in the minds of the taught, but in the methods of the teacher."

The examiners in the sections which have most right to be considered as technical or industrial are apparently the least satisfied. The defects in orthography, to which the examiner in mining alludes, might be overlooked, but when he describes the papers which were submitted in competition for "honours" as generally very imperfect, and showing a great want of practical knowledge, and that only six of the authors considered that even a general knowledge of mining was necessary, it is evident that in one part of the teaching at least a revolution is necessary. The examiner in geology believes it to be "very improbable that the pupils have much acquaintance with the things which they attempt to describe." In applied mechanics there is a similar haziness, for the "freehand sketches prove that there is no accurate knowledge of the construction or due proportion of parts in the particular thing described and sketched." The report on building construction is, we are glad to say, one of the least disheartening.

With regard to the art schools of the country, it is evident from the report of the examiners on the national competition works, which we published a fortnight ago, that either the schools are retrograding, or the theory of art which is held by the examiners is at variance with that of the Department. We read of slovenly execution, messy and woolly drawings, designs which are rank in colour, wanting in feeling, dignity

and sobriety, and stuffs which are offensively startling in colour. Praise is given for some classes of work, especially for examples from provincial schools, but on the whole there is more of fault finding. If in the highest class of work there is so much to be censured, what is to be said of the quality of the drawings which are produced by the majority of the eight hundred thousand students? The report of Mr. BARWELL on this point is not reassuring. To point out improvement in "certain large and very important places," he has to survey a period of no less than fifteen years. But in important centres he sees weary masters and schools languishing, and he cannot conceal from himself that too often the student is sacrificed to the needs of the master. "I am led to believe," he writes, "that a very great deal too much elementary outline from flat examples is carried over throughout. It is easier to teach, because it can be turned over to an assistant or pupil teacher. It leads to a definite pecuniary result in the second-grade examinations, and, with a large number, their ambition ends there, and the student is led to rest equally satisfied with the achievement." Mr. BARWELL has pointed out the great defect of the system which prevails in science no less than in art schools; but there is no possibility of its removal until the students recognise the fact that the best education is self-imparted, and that a teacher is only an auxiliary to remove difficulties.

The Committee of Council are able to record various gratifying events as having occurred in the South Kensington Museum in the course of the year. The Art Library has come into possession of the new rooms, and the gallery of casts from the antique was opened in August. From the report it would seem that the casts were primarily intended for the use of students, but it has been found that the public can take an interest in them. The acquisitions may not appear remarkable to a visitor, but over a thousand objects have been purchased at a cost of 16,514*l.* Among them are a massive gold Græco-Bactrian ornament, an unusually fine Persian carpet, and several examples from the Castellani collection. It is announced that a collection of about 1,200 specimens of English pottery and enamels will be presented by Lady SCHREIBER, and in that branch of industrial art the museum has not been rich. A new departure has been made by the appointment of a Committee of Taste, who will give advice on the acquirement of examples. Sir FREDERICK LEIGHTON is the chairman, and architecture is represented by Mr. BODLEY, A.R.A.

The amendment in the law of patents entailed an alteration in the status of the authorities with respect to the Patent Museum at South Kensington, which before then seemed to be independent of control. As a consequence several of the remarkable things which were to be seen in the shed have been returned to their owners. It is now stated that as soon as possible the entire collection will be removed to the western side of the Exhibition Road, in order that the whole of the scientific exhibits may be found together. Advantage should be taken of the change to overhaul the collection which is supposed by the authorities to represent building in this country, and which contains much that is obsolete and useless. There seems to have been no energy shown in securing examples which might make the collection correspond with its title. During the past year the expenditure on purchases has been only 22*l.* But while we are eager to see an adequate museum of building materials and models of construction at South Kensington, we must demur to the officers undertaking the duties of consulting architects. It is announced as part of the work of the year that "many inquiries as to sanitary goods and efficiency in drainage and ventilation have been replied to." Unless we are mistaken, the giving of advice of this kind is outside the province of the museum. There have been enough encroachments already on what should belong to architects at South Kensington, and the unoccupied time of the officers, although abundant, can no doubt be utilised in a less harmful and more becoming manner.

---

The Bedford Urban Sanitary Authority have adopted nearly every one of the amendments proposed by the local architects and builders for the new building by-laws, and have made an urgent representation to the Local Government Board for their prompt sanction.

## NOTES ON SOME PROVINCIAL CHURCHES.

[BY A CORRESPONDENT.]

THE church at Axbridge, Somerset, is a fine and interesting building, picturesquely situated at the base of the Mendip Hills. It has, as far as funds permit, been restored under the direction of Mr. SEDDING. As regards the tile and marble pavements to the chancel, the design appears rather too rich for the church of such a small country town, with which it is scarcely in harmony. Much study has been bestowed on the new oak west door, which must have been a very expensive work. The design is original, without being out of character with the Mediæval surroundings. There is some artistic skill in the ornamental strap hinges, which bear the inscriptions, "JESUS our refuge" and "Through life into death." The idea of this for a west entrance—used for marriages, baptisms, funerals, and other special occasions—is appropriate. We want a little more poetical feeling in our churches—something to lift us out of to-day and the commonplace into a clearer atmosphere, and such a "departure" is always to be welcomed and encouraged. The door furniture also shows considerable fertility of design with its escutcheon, &c., and was clearly made for this church.

At St. Mary, Walton-by-Clevedon, is a rebuilt church attached to the ruin of the lower portion of an old tower. The modern building is a good and well-designed one in the Early Decorated style. But the coloured decoration to the waggon-headed chancel ceiling is crude and poor, and the figures indifferently done. The Te Deum is represented by angels enclosed in circular medallions, while seraphim and cherubim are depicted in the two bays over the sanctuary. The ground is blue, with the addition of gold stars to the ceiling over the sanctuary. At the upper part of the east wall is the Agnus Dei in the centre, over the triplet window, with three adoring angels on either side kneeling on steps, arranged over the arched head, the central lancet being higher than the side ones. This seems an appropriate treatment, not only from a constructional but from an artistic standpoint.

The old parish church of Clevedon, which now stands westwards of the large modern town, is quaintly situated on the slope of a hill rising towards the Bristol Channel. It has been externally a good deal tampered with, so that at the first blush the archæological student might fancy it was a pseudo-ancient building. A little closer examination, however, shows that it is a genuine cruciform church built in Norman times, the greater portion of the tower being of that date. There is a Decorated south aisle to the nave, a south transept of unusually great projection, as long as the chancel, with two arched and cusped recesses in its south wall, where there were formerly monumental effigies. This transept must evidently have been originally designed as a chantry chapel. The octagonal piers to the nave arcade do not possess any capitals, but the arch mouldings, consisting of two chamfered orders die, into them, the outer order being corbelled out north and south from the piers. The absence of the usual capital has been the reason of this peculiar arrangement. The discontinuous arches to piers in work of the Decorated period is rare, but that to the nave of Lostwithiel Church, of Early English date, has already been mentioned. As an occasional variation in a village church, this treatment is not unsuitable. But at the same time it must be conceded that the capital is a more finished and refined way of emphasising the division between the pier and the archivolt. There are some good old oak bench-ends in Clevedon Church, with poppy-heads. I must not omit also to mention the curious cross-shaped form in the Decorated tracery of the west window to the nave.

In the parish church of Dolgelly, North Wales, is one feature which, in my recollection, I have never seen before. It is not ancient, but the idea is good. In lieu of a memorial floor brass is a design in tiles, the same size as an ordinary brass, representing a floriated cross. Where the expense of a brass is an obstacle, this pleasing and in every way appropriate substitute for it is not to be despised.

The fine old church of Llanbadr-fawr, near Aberystwith, is an excellent type, though of rather a severe kind, of a large cruciform building with massive central tower. Like many Welsh churches, and others situated

in a district where freestone is scarce, it is almost destitute of buttresses. The style is Early English nearly throughout, with small lancet windows, except the east window, which, when I saw it, was much mutilated, as was also the south priest's door to the chancel. The tower has a plain parapet, with scant embrasures. There is a lofty south porch, with fine outer arch consisting of three chamfered orders. How well this simple style of moulding, if I may call a chamfer a moulding, suits a village church! The inner doorway of this porch is almost a transition between Norman and Early English, and its mouldings are of the bowtel kind. Its reparation has been carried out with most conservative ideas; the replacing of broken mutilated jamb mouldings does not afford much margin for going wrong. Now, I think nothing can better suit the locality and situation of this North Wales church, hard by the sea-coast, than its severity. It is plain, almost to meagreness. Would that we modern architects would more often take our model from such buildings as these, which look as if intended to last for ever! But, unluckily, as a matter of fact, these Mediæval buildings with thick walls and every appearance of substantiality have failed, for very simple reasons—the absence of that primary and most important consideration of all, a good foundation, proper bond to the walls, insufficient means of carrying off the rain-water from the roofs, the want of a damp-proof course, the absence of warming apparatus, the practice of keeping a damp church shut up all the week without ventilation, and the accumulation of earth day after day, month after month, year after year, century after century, from interments, dust, fallen leaves, &c.; also from want of proper drainage to the churchyards. In how many Mediæval churches has the architect who has had the good fortune to be entrusted with their repair, found that there were absolutely no footings whatever! Turning to the interior of Llandbadr-fawr church we find it ceiled in pitch pine, with good carved bosses, very much like a Somerset church. As architecturally the north and south transepts differ, so also do the ceilings. The cornices of both are of different design. The central tower is elegantly vaulted in wood, the angles being canted over at the same level as the other roofs. It was clearly never used as a lantern. There seems to have been no freestone employed internally for the very sufficient cause already mentioned. The arches and angles are square and plastered. As the windows are small and plain, the interior is extremely simple, reminding one of some of the Italian basilican churches, or those in the south of France. By means of colour it might be rendered most effective with its majestic scale and proportions, were it not for the serious objection of damp walls, a very usual defect in this part of the country. The corona lights to the nave are somewhat slight in substance and scarcely in suitable character (being rather too much ornamented) with the severity of the interior, which demands simple massiveness in all its fittings. It would have been better to employ some neutral tints and a little gilding, sparingly put on. I cannot say that I like the cathedral-rolled glass in the transept windows. It needs some clear, white glass mixed with it, and the tints are, moreover, too pronounced. Let rolled glass keep to its preserves and look like rolled glass, and not ape the deeper shades of painted glass. On this rock how often the ship of the architect gets wrecked! It is so easy to go wrong and out of the proper course. The suspicion of a shade will make all the difference in the good effect, as I have painfully learned by my own experience. Under the central tower is a representation on the pavement in the form of a Greek cross, composed of handsome Roman marble mosaic (*opus vermiculatum* or *incertum*), with an arrangement of encaustic glazed tiles at intervals. In the centre is the Lamb, encircled by the evangelistic symbols. Angels bearing musical instruments, the elders casting their crowns before the throne, are here represented, the whole composition being evidently founded on that sublime chapter iv. in the Apocalypse. I must make the same remark about this pavement that I made about the lighting arrangements—it is a little too rich and elaborate for the church. The chancel, when I saw it, was still unrestored. It must not be thought from the above gentle criticisms that the modern work to the building is faulty. Far from it. It displays great care and the exercise of much originality of imagination; but, at the

same time, the able architect under whose directions these works were effected seems to have a little overdone some of his beautiful and well-conceived detail, which would better suit a town church.

Though it is deeply to be regretted that a fine Mediæval parish church like that at Banbury should have been ruthlessly demolished some years since, yet the Renaissance church which has been reared in its stead has many points of interest. Externally it possesses no architectural pretensions, though the lofty tower, which is of large scale, is rather picturesque. The stone employed is of a warm-coloured reddish brown. But the interior, both owing to its composition and also to its coloured decoration, executed a few years since by Messrs. HEATON, BUTLER & BAYNE, under the superintendence of the architect, Mr. BLOMFIELD, is very impressive. In plan the nave is octagonal, with aisles, the perspective effect of the oblique sides of the octagon being peculiarly good. The ceiling over the central portion is in the form of a cupola, with a rather flat curve. The splendid vision of the Apocalypse is represented in the ceiling of the apse concha of the chancel. Here is Our LORD seated in majesty, with the blessed on either side, the evangelistic symbols, or the four living creatures, as the Revised Version terms them, at the base of the throne, with the incense ever burning before it. On the south wall archangels are depicted. Beneath are represented the Twelve Apostles, ranged in three panels of the apse, four in each compartment, all severally bearing their proper emblems. The effect is very good. Really, on first entering this building I was struck with amazement. I asked myself, "Am I in an English church?" For I could fancy that I had been transported into one of the great Renaissance churches of North Italy. Happily the whole of the ornamentation is perfectly suitable to the doctrine and ritual of the English communion. I therefore reckon my acquaintance with the interior of this structure as one of those delightful surprises in which some of the pleasure and happiness of life consists. The artists who had the management of the work are much to be congratulated on the result.

## THE SCIENCE AND PRACTICE OF VENTILATION.\*

By ROBERT BOYLE, Ventilating Engineer.

(Continued from page 363.)

THE subject of ventilation can never be placed on the most desirable footing till the architect shall always design in unison with its principles, and make them a "primary," instead of a mere secondary, consideration, in his structural arrangements. When this is not done, the means of effecting ventilation economically may too often be considered as superseded, before any attention has been paid to them. It is sometimes argued that ventilation is expensive, and that the cost is such as to preclude the general introduction of extended arrangements. Such reasoning has no force, unless received in connection with the special circumstances of each individual case. Systems of ventilation are often compared by parties who never take the trouble to inquire as to the amount of air which each may be capable of supplying for the sum expended upon it. If they did so, they would find that it is not at all necessary to adopt elaborate and expensive artificial appliances, when the same, if not better results, can be obtained by the use of much simpler and cheaper arrangements, and with which there is no trouble or after expense involved to keep them in operation.

It may be accepted as an axiom that even by the use of the best ventilating arrangements, we can only secure in our dwellings and public buildings air of a certain standard of impurity, as it is next to impossible to maintain the internal air in the same state of purity as the external. Another of the impossibilities connected with ventilation is that of satisfying every one; it cannot be done, and it would be useless to attempt it.

RICHARDSON says:—"To please all parties in the warming and ventilation of a public room is one of the most

difficult, if not really unattainable, tasks that can be imagined." When Dr. REID had completed the application of his system of ventilation to the House of Commons, in relating his experience of how it was appreciated, he states that "the first remark made after the House met was, 'The temperature is rising, we shall be suffocated immediately.' This was addressed to me by a member walking from the bar to the door, and he had no sooner passed than another followed him, hurriedly stating as he passed, 'I am shivering with cold, I can bear this House no longer.' . . . I have repeatedly during this very session been present in the House of Peers when members have left it, some because it was too hot, and some because it was too cold, at the same moment. . . . I have been quite at a loss how to proceed, from the great diversity of opinion entertained by different members." Dr. REID's experience may be taken as the experience of all who have attempted the ventilation of public buildings, and it will always be so, so long as human nature remains as it is.

It is much to be deplored that the interest awakened in sanitary matters has given birth to a set of unscrupulous persons, who, pirating sanitary inventions of established worth, attempt to palm inferior and cheaply got-up imitations upon the public, the failures of which tend greatly to bring discredit upon useful and genuine inventions, and to inspire distrust in the public mind with respect to sanitary and ventilating appliances in general.

These imitations are, as a rule, purposely "got up" to resemble as nearly as possible in external appearance the article imitated, with the intention of leading intending purchasers to suppose that they are getting the same thing at a cheaper price, whereas there is in reality the greatest difference in the world between the action of the one and the other, as the unlucky purchaser of them very soon finds out to his cost.

The host of nondescripts who now dub themselves "ventilating and sanitary engineers," is, it is much to be regretted, steadily on the increase. These people do an incalculable amount of harm to the cause of sanitary science, owing to their extreme ignorance of the subject they pretend to be "professors" of, as, unfortunately, there are always some people to be found who allow themselves to be taken in by specious pretensions. These individuals as a rule hold out the alluring bait of "cheapness" to entrap the unwary, who find out, however, all too soon that what they had so confidently thought "cheap" would be dear at any price. This discovery is of course all the more mortifying when they afterwards find that they could have obtained genuine and efficient appliances and the best skilled advice and labour at the same, or for even a less, sum than what they had paid. These "practitioners" rely upon the fairly safe chance that the majority of intending purchasers may not have either the opportunity or the inclination to compare prices.

There is no royal road to the attainment of a knowledge of sanitary science, as, like all other sciences, it necessitates many years of careful study and practical research before even an ordinary degree of proficiency can be attained. It is, therefore, unreasonable to suppose that any person having only the most meagre and superficial acquaintance with ventilating appliances—obtained, perhaps, through acting as an agent for the sale of ventilators, or as a traveller canvassing for orders—can when he chooses, and on the strength of such knowledge, transform himself into a duly qualified ventilating and sanitary engineer, without first having undergone that extended scientific and technical training which is as essential for his success as it is for a medical man to devote several years to the probationary study of medicine before he begins to practice it. DE CHAUMONT will be found to be correct when he says:—"The greatest engineering skill is necessary in the arrangement of tubes, the supply of fresh air," &c.

The mere application of a ventilator to a building by an unqualified person, no matter how good the ventilator may be, will no more secure efficient ventilation than putting a steam boiler into the charge of a person ignorant of its management will set the machinery in effective motion. The ventilator and the boiler are good and useful in themselves, but to secure the full amount of benefit from them it is absolutely essential they should be applied by some one skilled in their adaptation to the requirements of the case,

otherwise failure to achieve what is desired will inevitably ensue.

Ventilators should never be purchased and stuck on to a building at hap-hazard. This is the cause of the many failures to secure ventilation where they have been so applied. A properly qualified ventilating engineer should be consulted as to the size, number, and positions of both outlets and inlets. This advice may generally be had from a respectable firm for the trouble of asking, and if acted upon would save what otherwise might prove a useless expenditure of money, and at the same time insure satisfactory results.

It should always be borne in mind that so-called "cheapness" is a snare in matters of ventilation, as it is not the amount expended that should be considered, but the results which are obtained for such expenditure.

The lessons intended to be conveyed by the foregoing remarks may be briefly summarised as follows:—

1. Pure air in our dwellings and public edifices is absolutely necessary for the preservation and maintenance of health.

2. In changing the air of a room the vitiated air should always be extracted from the highest point, and fresh air admitted in a vertical direction above the level of the head.

3. In a large room or hall the vitiated air should be withdrawn through several openings in the ceiling in preference to one or two, to facilitate and equalise the quantity of air extracted from the different parts of the room.

4. The supply of fresh air should be subdivided as much as possible, and introduced at a low velocity through a number of small openings or vertical tubes placed round the room, to insure thorough diffusion and prevent draughts.

5. Air should never be artificially forced into a building, as the inevitable result is defective ventilation and disagreeable and dangerous draughts, even though the air be warmed. "Rude and local currents, whether cold or hot, always indicate imperfections which should be banished" (REID).

6. If artificial means are employed, it should only be for the *extraction* of air, never for the admission, for the reasons stated above.

7. When possible, the air supply should be warmed in cold weather by some simple means, such as the arrangement described.

8. All mechanical or artificial modes of ventilation, such as fans, water motors, or heat, are, for all ordinary purposes, not to be recommended, as being unnecessary, costly, unsatisfactory in action, liable to get out of order and break down, and apt to be neglected by those appointed to look after them, when the ventilation is rendered irregular or brought to a standstill.

9. Where heat is employed as the ventilating medium it is essential, to permit of its proper action, that the pressure of the external atmosphere, especially in cold weather, be removed from the top of the upcast shaft. This can only be effected by the use of extracting ventilators of proper construction, the "louvre" arrangement usually employed being invariably found to impede the up-draught and create down-draught.

10. Any arrangement which artificially saturates the air supply with moisture, and renders it damper than what in this climate is its normal state, should be avoided as pernicious in principle, dangerous to health, and destructive of comfort.

11. Automatic or natural ventilation is the best, the least expensive, and the easiest of application and control. "In temperate climates, in most cases, natural ventilation is the best" (PARKES).

12. Revolving ventilators are not to be recommended, as they are unsightly, liable to get out of order, make a noise, and frequently act the wrong way.

13. Fixed ventilators are the best, as they can be made to harmonise with every style of architecture, cannot get out of order, and require no attention.

14. The extracting power of a roof ventilator lies exclusively in its head, and is regulated by the size of the same, and not by the diameter of the shaft attached to it, which in no way assists the action of the ventilator as an exhausting medium.

15. Open pipes, or pipes merely covered with a cap, are not to be relied upon as foul-air extractors, as wherever they

have been used for the purposes of ventilation a down-draught of cold air has always been found to result.

16. It should be borne in mind that the subject of ventilation is one of the most complex and difficult that is in existence, and can only be successfully dealt with by those who have made it their special study for many years. "The greatest engineering skill is necessary in the arrangement of tubes, the supply of fresh air, &c." (DE CHAUMONT).

17. Ventilators should never be applied to a building at hap-hazard, as failure is the inevitable result. They should only be applied under the advice of a competent ventilating engineer, which advice can generally be had for the asking.

## TESSERÆ.

Sir Joshua Reynolds.

SIR M. A. SHEE, P.R.A.

THE more we study the works of Reynolds the more we find reason to admire the variety of merits which they display. In colouring he has often equalled the best productions of Titian; he has sometimes surpassed them. The author knows what he risks by this assertion, but it is time to speak out and do justice to the genius of our country. To Titian, as to the great and long-established model of truth and purity in colouring, every scientific eye must look with admiration and respect; but the author confesses that he has not been able to discover, even in the most celebrated productions of the Venetian school, an example of excellence in this department of art, which would not, at present, suffer in comparison with some of the finest specimens of Reynolds. In the management of light and shade, he unites to the vigour and science of Rembrandt the delicacy and breadth of Correggio. In character and expression, he presents the truth of sentiment and action, without swell or exaggeration. His dignity is never the strut of the stage, nor his passion the struggle of grimace. In taste, that peculiar power of the artist which "turns the happiest attitude of things," he is absolutely without a rival in modern times. In spirit and facility of execution, and in all those merits of mechanism, material, and surface, which appear to be as much over-rated in our school as they are under-rated in the schools of the Continent, he has never been surpassed. In composition, indeed, though often successful, he cannot be said to be eminently skilled; and in design he is confessedly deficient. This latter defect, however, he manages with so much judgment, that his incorrectness seems more the result of negligence than inability. He, at least, indicates what he fails to express; and, as he never suffers the awkwardness of unsuccessful effort to appear, his academic deficiencies are hardly noticed amongst such varied accompaniments of acknowledged excellence.

## Copying by Greek Sculptors.

W. W. STORY.

Had the Greeks understood the modern process of casting in plaster from the clay, or from a statue, they could, from the cast, have multiplied in marble the same statue any number of times identically, or with such minute differences as few eyes could perceive. The *repliche* in a modern sculptor's studio are scarcely to be distinguished from each other, and there would have been no difficulty in doing the same thing in an ancient sculptor's studio. What is the fact known? So far from this being the case, not only are there comparatively very few *repliche* even of the most famous statues, for which there would necessarily be a great demand, but even in the various *repliche* which we have there are not only no two which approach to identity either in attitude or size, but one can scarcely say in any one of them that the artist had more at best than a vivid recollection of the original, or of some other replica, much less that he had it before him to copy even by eye. Often the attitude is changed as well as the size and proportions; sometimes the action is reversed, and in all cases such differences exist as it is impossible that the clumsiest workman could have made with a cast of the original before him. Nor do we read or hear of any copies in our sense of copy, that is, exact reproduction of any of the great works of the great sculptors. Look, for instance, at the *Venus* of the Capitol, and the *Venus de Medici*, and the St. Petersburg *Venus*. They are all *repliche* of the renowned statue by Praxiteles; but, beyond the general attitude, there is no resemblance, not so much as any clever artist of to-day could make from mere recollection. Look, again, at the portrait busts? How many are there of Marcus Aurelius, Octavius Cæsar, and Lucius Verus, and no two of them approaching identity? Of the thousands of statues which have been excavated, no two are exact copies from the same model. There is at best nothing more than a family resemblance among those which are most alike.

Would this be possible if the ancients knew and practised the art of casting in plaster as we do? It would seem to be utterly impossible, or at least improbable to the highest degree.

#### English Indifference to Greek Work.

E. J. POYNTER, R.A.

I the more regret the decline of the taste for antique art in England, because so many of the beautiful works collected up to fifty years ago by cultivated men are leaving the country, and none seem to be entering it. The French have replaced us in that respect, while our collectors of the present day devote themselves to blue china—a taste, it is true, which requires no education. Of all the hundreds of the exquisite little terra-cotta figures from Tanagra which have been discovered within the last ten or twelve years, not a dozen, I believe, have found their way into private collections in this country; there are a few in the British Museum. The French have the good taste to buy them all. I do not imagine that the best of these exquisite works, the purest expression of the Greek artistic instinct, ever rose in price to that of a “hawthorn” jar at Christie’s; and yet there is more art in the little finger of the man who made one of those figures than in the whole Chinese nation.

#### Landscape Painting.

HARTLEY COLERIDGE.

Every painted landscape, if it possesses the unity essential to a work of art, must make a whole of what in Nature is felt and understood to be but a part—perhaps a part as unconsidered, if not as prominent, as the nose on the face. In Nature we are glad to merge our human individuality in the universal, while in art we demand that everything should be humanised, and refer to man as its centre and solution. We require a meaning, a purpose in every line, and light and shade. I think sylvan scenery paints the best of any. In glades and copses the eye is confined to a small indefinite space, and to a few picturesque objects, which fancy can multiply and vary as it chooses. The effects of light and shadow are strongly marked, and within the reach of imitation. The distance seen through vistas of trees, or peeping between the branches, affords a most intelligible perspective. A wood is a sort of natural diorama. Trees, too, are individuals, and, being liable to the operations of time, have a poetical sympathy with human life, which, in lakes and mountains, can hardly be imagined. Scenes again over which a human interest presides, where the steep is crowned with castle or convent, and the long aqueduct stretches across the vale, and towers, domes, minarets, loom in the distance, and the foreground is strewn with broken columns and marble fountains, which Nature has taken to herself again, do very well. But where Nature reigns alone, and man only appears to show his insignificance, where every portion derives its beauty from the co-presence and co-inherence of the whole, art can do little more than hint at what it cannot do, and present a humble index or chapter of contents to the volume, which can neither be translated nor transcribed.

#### Architectural Proportion.

PROFESSOR COCKERELL, R.A.

Vitruvius (lib. vi. c. 2, 3, 4, 6; lib. v. c. 1, and c. 2) gives us the experience of the ancients on this important subject. The Greek forum, says he, was a square, but the Roman was 3 by 2, because the gladiatorial shows were exhibited there; courts should have the proportions of 5 by 3 (the favourite of the learned Palladio), sometimes 3 by 2, or sesquilateral, or the diagonal of the square will be the length. He lays down the proportions of all the apartments of the Greek and Roman house: atria, alæ, tablinum, and peristylum, triclinia, cæci, exedrae et pinacothecæ. He does not, however, establish any principle, and his rules are wholly empirical. But the great Alberti, not content without a principle, adopts the Pythagorean doctrine of universal harmony, and agreement between sounds and numbers, namely, that what pleases the ear pleases also the eye. He lays down, therefore, his harmonic proportion, in which Blondel, Ouvrard, and others have followed. The notion of musical proportions is common, and has occupied many ingenious minds already versed in that art. Describing St. Peter’s, Byron in this feeling observes:—

Vastness which grows, but grows to *harmonise*,  
All musical in its immensities.

Alberti was the first also to establish the rules of arithmetical and geometrical proportions (lib. ix. c. 3, 4, 5, 6), applied to all the varieties of areas and capacities. He is followed by Palladio in the arithmetical and geometrical rules (lib. i. c. 23). It is a comfortable conclusion to the practical architect that the empirical rules of Vitruvius, the harmonic, the geometrical, and arithmetical rules of Alberti and his followers, agree in the main; so that either may be adopted without material deviation from correctness; but the neglect of these rules, in which lie that hidden charm that everyone must be sensible of when examining a finely proportioned room, has been common of late

years, as if the principle were of no value. The zealous student, therefore, should carefully note that consent of the ancients and the most illustrious masters of the moderns here set forth; and he will soon learn devoutly to repeat the denunciation of the Hindu Vitruvius (Ram Raz, Asiatic Society, 1834, p. 15), “Woe to them who dwell in a house not built according to the proportions of symmetry.”

#### Manx Crosses.

J. G. CUMMING.

The Danes and Northmen occupied the Isle of Man from the beginning of the tenth to the latter part of the thirteenth century, and the memorials of their occupation are distinct and numerous, both in the social institutions of the island, in the names of hills, rivers, &c., and especially in the Runic crosses, which in the northern part of the island are so numerous that in a mountainous area of sixteen miles by ten no less than twenty-nine different examples are to be found. Many of them have inscriptions in Runic characters and in Icelandic, the ancient Scandinavian tongue. The close connection between the Northmen in Ireland and their countrymen in Man serves to explain the similarity of the crosses found in each island, and their resemblance to those in the Western Highlands and Scottish Islands is explained in the same manner; but the Manx crosses are distinguished by local peculiarities indicating a less advanced state in the art of ornament. The various animals, weapons, &c., which are found on them have no object probably beyond ornament, as they are often employed as terminal ornaments alone, the cock being a favourite bird for the last purpose. In all cases the cross has a circle, or glory, more or less indicated upon it, and the Runic inscription is written on the edge from the ground upwards. Many crosses have been recklessly destroyed, and many of those discovered owe their preservation to having been built into the old parish churches, and brought to light only when the latter were pulled down to be rebuilt, between the years 1825 and 1835.

#### The Roman Corinthian.

W. H. LEEDS.

That what the Romans made of this order is not to be judged of by the comparatively few examples of it to be gathered in still existing buildings, is tolerably apparent from the innumerable fragmentary specimens of it which are to be met with scattered through different museums and repositories of works of art, each of which is distinguished by some peculiarity. How many others have totally perished it is impossible to say; but when the Solomon of the West, the magnificent Abderahman III., erected his palace at Zahra, near Cordova, he collected for its embellishment no fewer than 4,300 Roman columns, the greater part of which were obtained from Africa, a considerable number from other parts of Spain, 146 from Constantinople, and not a few from Rome itself. To columns plundered from Roman edifices, not a few Mediæval buildings in the south of Europe were indebted for a species of magnificence that, in many instances, contrasted very forcibly with the rudeness and poverty of the rest of the architecture, and, although only fragments from a large wreck, such transplanted columns afford tolerably plain evidence that the Roman understood how to impart great diversity of character to what conformed to the same generic type.

#### Ancient Egyptian Furniture.

SAMUEL BIRCH, LL.D.

The furniture of the ancient Egyptians consisted principally of rich beds, or couches with their beds, or mattresses, pillows, and cushions, and wooden head-rests, footstool-stands, tables and chairs, both with high and low backs; or folding-stools, like the Greek *okladias*, boxes for holding clothes and other objects. From the earliest period high-backed and other chairs were in use, and at the time of the eighteenth and nineteenth dynasties were imported as tribute from Ethiopia. Pillows of stone, wood, and other objects were also of great antiquity, and are represented in coffins of the sixth and following dynasties. They exhibit a great variety of shape, consisting of a curved semi-elliptical portion, adapted to hold the back of the head, supported by a column or other contrivance resting on a base or pedestal. For furniture various woods were employed; ebony, acacia, or santon cedar, sycamore, and others of species not determined; ivory, both of the hippopotamus and elephant, was used for inlaying, as also were glass pastes, and specimens of marquetry are not uncommon. In the paintings in the tombs gorgeous pieces of gilded furniture are depicted. For cushions and mattresses, linen cloth, feathers of the water-fowl, and coloured stuffs appear to have been used, while seats have plaited bottoms of linen cord, or tanned and dyed leather thrown over them. Sometimes the skins of panthers were used for the purpose. On the whole, an Egyptian house was lightly furnished, and not encumbered with so many articles as are in use at the present day. For carpets they used mats of palm fibre, on which they often sat.

## ILLUSTRATIONS.

THE ARTS: THE ARCHITECT.

THIS illustration is the sixth and final of the series by M. EHLMANN.

CHURCH, WELLESLEY ROAD, CROYDON.

THIS building is designed after the manner of a college hall rather than on a strictly ecclesiastical basis. The interior is small, and has been treated especially with a view to the comfort of those attending the services. The seats are of a novel and improved form, the walls are panelled to a height of about 10 feet, and the ceiling is nearly flat, with moulded ribs dividing it into panels. Externally the whole of the work is executed in Bath stone, and the character of it is sufficiently shown in the view. The architects were Messrs. CHORLEY & CONNOR, of 15 Park Row, Leeds.

SUN FIRE AND LIFE OFFICE, ST. ANDREW STREET, DUBLIN.

THIS building is now in course of erection for Messrs. O'DONELL & FITZGERALD, stockbrokers, and occupies a corner site near the centre of the city. The stock-broking offices and insurance office are on the ground-floor, and the remainder of the building is in suites of offices. The frontage to the street is 80 feet, and the height to the finial of angle turret 88 feet. The facing of ground storey is of chiselled granite, and of the upper portion of red Kingscourt bricks, the dressings of windows, &c., being of Portland and Bath stone. The roof will be covered with Westmoreland green slates, and the joinery throughout is in pitch pine, with which material the ceilings of ground-floor offices will be panelled. The entire work is being carried out by Messrs. MEADE & SON, builders, of Dublin, under the superintendence of the architect, Mr. G. C. ASHLIN, R.H.A., at a cost of 5,086l.

The illustration is a reproduction of a coloured drawing which was exhibited at the Royal Hibernian Academy.

PULPITS IN ST. CLEMENT'S, ROME.

THE church of St. Clement was always considered to be extremely interesting as a record of primitive ecclesiastical arrangements. But the discovery of the subterranean crypt, with its frescoes, has to some extent superseded the importance of the upper building. The two marble ambones, or pulpits, which Mr. BARRATT has sketched, are supposed to date from the ninth century. One was used for the reading of the epistle for the day by a subdeacon, the second for the reading of the gospel by a deacon. The twisted column supported the Paschal candle.

LA GROSSE HORLOGE, ROUEN.

THIS sketch is by Mr. C. S. STEWART, of Reading.

SKETCH IN NUREMBERG.

THIS sketch is by Mr. R. M. ROE, of London.

## ART SCHOOLS.

AMONG the reports of the inspectors to the Science and Art Department, Mr. Barwell reports as follows:—

Of the varied duties that fall to the lot of the inspectors, only such as relate to actual inspection need here be referred to, nor am I able to give any valuable opinion on the teaching in the science section, except perhaps to remark that machine drawing has very much disappeared from certain schools of art where it once largely flourished. I have been informed that highly finished work of the kind is greatly superseded by the photograph, and hence a decreased demand for the skilled draughtsman.

Schools of art are increasing steadily in number. Some, however, are so small and insignificant that they are only kept alive by the higher fees received from the amateur morning classes, chiefly attended by ladies, and where a very poor kind of art, if art it can be called, is aimed at. Indeed, the latter remark holds good of similar classes in many schools of an

otherwise better kind, and it requires either a good tradition or a very firm and able master to get higher effort from the mere amateur at a school of art. I do not advocate their exclusion; on the contrary. But if they are admitted, they should be bound to undertake serious work. Turning to the industrial student, I am led to believe that a very great deal too much elementary outline from flat examples is carried on throughout. It is easier to teach, because it can be turned over to an assistant or pupil teacher. It leads to a definite pecuniary result in the second-grade examinations, and with a large number of teachers their ambition ends there, and the student is led to rest equally satisfied with the achievement. Many of the elementary casts are not at all more difficult to outline from than a flat copy, and a judicious teacher could soon lead the more intelligent on to light and shade by taking cast shadows alone at first, and when that has been acquired proceed to the more important half tones. The otherwise ugly German elementary casts are admirably adapted for this purpose. Success on the student's part rests indeed with the teachers, and if we want to get good work out of the former we must hammer away at the latter and teach them to teach.

A few schools of art in important centres still languish in the hands of inefficient masters who received their training many years ago, and who, besides lack of better knowledge and system, have grown weary of their work, yet cannot afford to resign; their committees, too, are naturally loth to turn them adrift or are ignorant of their incapacity.

One frequent drawback is the want of better accommodation, a need gradually recognised in the larger towns, and each year there is improvement in this respect. Pictorial art is the goal of a certain number of students in every large and in many smaller schools; nor do I see how this can be prevented, as a good art education for the decorator will go a long way towards the training of a painter. Indeed the latter would profit by the more extended range of the former, if the decorator's art be taken in a large sense.

Premising that a vast amount of ornament finds its proper place as enrichment of structure, I think the study of architecture is not sufficiently carried on and encouraged in schools of art. A knowledge of orders, mouldings, and proportions, and a general acquaintance with the various styles so useful in many handicrafts, requires more attention than it gets, except in one or two localities. Looking back upon the work done in the schools of art for the last fifteen years, I am of opinion that in certain large and very important places a decided improvement has taken place. As to the smaller centres, if they be lucky enough to pitch upon a good teacher they do well enough. Unfortunately for them the best trained and ablest masters naturally gravitate to the big places, and if none such require their services they paint for exhibitions or teach privately, and the smaller localities must content themselves with what they can get out of the art night classes. Where classes have been established by the teachers, and gentlemen have been induced to act on the committee by the promise that they shall have no trouble, the latter are apt to pay too little attention to the undertaking which they sign to visit the classes and see that all goes on regularly. Where gentlemen interested in education have taken the initiative, rules and regulations are better observed.

## THE ARCHÆOLOGICAL CONGRESS AT DERBY.

THE Royal Archæological Institute has definitely fixed the last week in July and the first in August for this year's Congress, which is to be held at Derby, under the presidency of Lord Carnarvon. Among the patrons of the congress are the Dukes of Norfolk, Rutland, and Devonshire, the Bishops of Lichfield and Southwell, Lords Hartington, Vernon, and Scarsdale, and Bishop Abraham. Mr. Beresford-Hope, M.P., will preside over the architectural section, the Dean of Lichfield over the historical, and the Rev. Dr. Cox over the antiquarian. On Tuesday, July 28, the members of the Institute will be publicly received by the Mayor and Corporation of Derby, and by the local archæological and natural history society; and in the afternoon Kedleston Church and Hall will be visited. Wednesday, the 29th, will be devoted to Norbury House, Ashbourne, and Tutbury Castle, church, and earthworks; Thursday, to Chesterfield and Hardwicke Hall; Friday, to Bakewell, Had-don Hall, and Yougholgreave Church; and Saturday, to Dale Abbey, Sawley, Breadsall, and Morley. On Monday, August 3, an excursion will be made to Repton, with its church, school, and priory, as well as to Breedon Priory and Melbourne Church. On Tuesday, the 4th, the party will go by railway to Chapel-en-le-Frith, and drive thence to Castleton, Peak Castle, and Tideswell. On Wednesday, the 5th, they will go by rail to Hassop, from which place they will drive to Padley, Carls Wark, and Hathersage. A temporary museum will be opened at the Free Library, Derby, rooms in which will be placed every evening at

the disposal of the sectional meetings. On the evening of Thursday, the 30th, there will be a conversazione, given by Lord Percy and the other members of the Council, at the Free Library, for which a large number of invitations will be issued to the gentry of the neighbourhood. The Mayor of Derby has undertaken the office of chairman of the local committee, and the excursion arrangements will be under the management of the secretaries of the Institute, Messrs. Hellier Gosselin and St. John Hope.

### THE ROMAN GHETTO.

THE demolition of the oldest Jewish quarter in Europe, dating, it is said, from before Cæsar's time, is proceeding rapidly. The archaeological commission which is charged with the exploration and protection of ancient monuments has applied to the Italian Government that measures shall be taken for clearing the temple of Jupiter and the portico of Octavia from the buildings which have grown up around them, and also for putting them in such a state of repair as is necessary for their preservation. The commission also requests that the new streets which are to be laid down over the cleared area shall be so planned that their points of intersection shall coincide with the following ancient buildings, which are now within the Ghetto:—The theatre of Marcellus, the crypt of the Emperor Balbus, and the porticoes of the Flavian emperors and of the Emperor Philip. There is a supplementary request that these buildings shall be placed on the list of ancient monuments, for the preservation of which a small contribution is annually made by the State.

### DEVONSHIRE ARTISTS.

AN exhibition of the works of Devonshire artists will shortly be held in Exeter. It is surprising to find how large a number of artists the county has produced, for while Middlesex, including the whole of London, of course, heads the list with one hundred and sixty-six native-born artists, Devonshire comes next with thirty-three—more by eleven than the two counties next in order, namely, York and Somerset. It should, however, be explained, says the *Exeter and Plymouth Gazette*, that these numbers represent only that small number of artists whose birthplace Redgrave, in his "English School of Painting," had been able definitely to trace, and it may well be that our county has produced many more artists of some, if not of considerable note. And, indeed, Mr. Pycroft's little volume contains the names of no less than sixty-five artists claiming Devonshire as their birthplace, and this does not include several artists whose work, though sufficiently well known in their own immediate neighbourhood, has not acquired any extended recognition.

The committee of the Art Exhibition determined some time ago to get together as far as possible a collection of pictures illustrative of the styles of the various artists whom the county has produced, but it was felt that so far as the living artists were concerned, they might be trusted to aid the committee by themselves taking care to be represented. It was therefore necessary only to consider how examples of the work of deceased Devonians were to be obtained, and to draw up a list of those who should be represented. Mr. Pycroft's list enumerated forty-nine, and it was felt undesirable to add many names to his list, as he had with great discrimination selected those worthy of being held in remembrance. It is gratifying to learn that examples of the work of nearly all the painters included in this list have been obtained by the exertions of the committee, and that a collection of great local interest will soon be open to the inspection of the public. These pictures have been collected from many of the best galleries in the county, and the owners have in the most liberal manner placed their works of art at the entire disposal of the committee. We hope before long to present our readers with a preliminary notice of the numerous pictures which have been promised for the exhibition; now we have space only to mention certain *desiderata*, which we fear the committee will have some difficulty in obtaining. And first on the list is John Shute, a celebrated miniature painter, who died in 1563, and of whose works nothing but the remembrance seems to remain. Then it seems no examples of Francis Hayman's work have so far been obtained, though he was a well-known artist in London in the time of Hogarth, and continued to paint historical pictures until his death in 1776. Nor has anything by Thomas Jenkins, who died in 1798, been obtained, though he was an artist of some talent, and a pupil of Hudson. R. Davey, the portrait painter, who died in 1793, and Ozias Humphry, the miniature painter and Academician, are also so far unrepresented, as are W. Score, J. Cranch, and T. W. Upham. Two less well-known artists, J. F. Stevens and Dorothea Knighton, are also without examples, as are John Ponsford, J. P. Davis, W. Salter, and H. Hainsellin. The younger Condy (N. M.) is so far represented only by a series of very charming but small water-colour

drawings, which were originally the property of Lord Egremont. All the other artists in Mr. Pycroft's list, as well as some others, such as F. Towne and the late Mr. Jeffreys, are, we believe, represented by more or less perfect examples, and we trust that, before the opening of the exhibition, not a few of these also will have been added to the list.

### THE EDINBURGH CROSS.

THE restoration of the Edinburgh Mercat Cross is to be begun immediately as the plans have received the sanction of the Town Council. The preparation of the designs was committed by Mr. Gladstone to Mr. Sydney Mitchell, who has consulted the most authentic drawings and details extant. Mr. Mitchell's designs of the old cross show a structure quaint and picturesque in appearance. The lower part of the edifice is, as nearly as possible, a restoration of the cross of 1617. The previous structure, of which no drawings exist, had been taken down by the magistrates of the period, with the view of widening the High Street, on the occasion of King James VI.'s visit to his native country, and the 1617 cross was erected in its stead. It is an octagon, about 16 feet in diameter and 15 feet high to the top of the parapet. At the angles of the octagon are eight Ionic columns, and from their eight capitals, eight bastions or rounded turrets are corbelled out. In the curtains or flat spaces of the parapet, between the bastions, are eight medallions—that over the doorway containing the town's arms, which will be copied from the original medallion at Abbotsford. On the other medallions in the old cross were heads in relief, of more ancient workmanship than the rest of the edifice. Four of these passed into the possession of Sir Walter Scott, and were built into the garden wall at Abbotsford. It would appear that the present proprietors of this classic mansion do not see their way to part with the old medallions. In the absence of the originals it is not intended to reproduce the heads, which are of mythical personages, and of little artistic merit. Had they been obtainable they would have been historically interesting as a connecting link between the restored and the ancient structures, of which they at one time formed an ornamental part. On the medallions, therefore, of the restored cross will be carved the arms of Mr. Gladstone, as also those of Mrs. Gladstone; the royal arms of Scotland, of the United Kingdom, and other appropriate devices. Between the Ionic columns are eight semicircular arches, with key-stones and key-blocks. In the centre of one of these arches is an oak door, studded with nails, by which access is obtained to a stair leading to an open platform on the top of the cross—upon which thirty people might easily stand. This platform is 13 feet from the ground, and the parapet rises 3 feet higher. Three bands of carving are carried round the cross—one consisting of a series of flutes, the second of acanthus leaves, and the third of an egg and dart pattern, and each bastion is provided with a gargoyle. Round the base are three steps, which will add to the height of the structure. Rising from the centre of the roof platform already referred to will be the old shaft with its capital and unicorn, which at present stands within the railing of St. Giles's Cathedral. The cross will be built of Hermand stone from a quarry near Mid-Calder. The Town Council have fixed the site for the restored cross in the open space between the east end of St. Giles and the police buildings. When it is finished it will, no doubt, be made by some legal instrument the "mercato cross" of the city, and from its platform royal and other proclamations will again be read by the heralds as in the olden days.

### FIRES IN LONDON.

A MEMORIAL from the London Chamber of Commerce was lately presented to the Metropolitan Board of Works urging that, owing to the inadequate protection now afforded against fires in London, "the Metropolitan Fire Brigade should be materially strengthened, with a view of lessening the hardships to which insurers are subjected on account of increasing danger from fire in the metropolis, and the heavily augmented premiums required by the insurance companies to cover additional risks." After setting forth at some length the views of the Chamber, and mentioning, among other considerations, the fact that insurers losing or suffering from damage to their property by the action of the Queen's enemies are unable to recover any indemnity from the insurance companies under their fire policies, the memorial concludes with the prayer that the Metropolitan Board of Works will "increase the strength and appliances of the Metropolitan Fire Brigade, providing for the same by additional contributions from the public, and in such a manner that the increased cost should not fall upon the insurers only, but also on (a) the uninsured, (b) the inhabitants of the metropolis, (c) the Government, and (d) the insurance offices." In reply, Mr. J. E. Wakefield, the clerk of the Board,

writes, under date June 13 :—"The Board's power in respect of the Fire Brigade is limited to the measure of the pecuniary resources placed at the Board's disposal for the purpose by the Legislature. At the present time the expenditure upon the Fire Brigade is considerably in excess of the statutory income; and a Bill which the Board introduced into Parliament last session for increasing this income failed to pass, mainly owing to the declared opposition of the fire insurance companies, whose contributions it was proposed should be augmented in proportion to the increased charges to be placed upon the ratepayers. I am, however, to state that so soon as the Legislature shall have placed the Board in possession of additional resources, the Board will carefully reconsider the requirements of the metropolis as regards its protection from fire."

### EXCAVATIONS AT EPHEBUS.

A MEETING of subscribers and others interested in the completion of the excavations at Ephesus, on the site of the Temple of Diana, was lately held at the rooms of the Royal Society of Antiquaries, Burlington House. The Bishop of Durham presided, and among those present were Mr. A. Beresford-Hope, M.P., Professor C. T. Newton, Mr. J. T. Wood, Mr. Bond, principal librarian, British Museum; Mr. W. Lowther, M.P., the Dean of Llandaff, the Rev. Sir Talbot Baker, Mr. S. Simpson, and Mr. T. Hayter Lewis, honorary secretary.

The Bishop of Durham, in an introductory address, expressed his belief that from excavation and exploration our great acquisitions in history were to be obtained. We had almost exhausted all that could be acquired from extant literature. It was, indeed, quite possible that we should at one time or another discover a new classic, but from the inscriptions chiefly, almost entirely, our great acquisitions of knowledge were henceforward to be obtained. Of all the regions in the earth, the most promising for excavations, if he mistook not, was Asia Minor. Of all districts of Asia Minor the one which bade fairest to give us valuable results was the pro-Consular provinces, of which Ephesus was the capital. Therefore, their interest must centre in Ephesus. He was quite sure that in many departments of knowledge far more was to be learnt from the inscriptions than from the extant literature. It was so, for instance, in the political and municipal life of the cities of Asia Minor. It was so with regard to their outdoor life, festivities, and the like. It was so especially with regard to their religious life. For example, they really had not the faintest conception of the power and vigour of the Roman *Cæsar* worship, or State worship, which culminated in the middle of the second century in Asia Minor, until they made a careful study of the inscriptions. Above all was the predominance of the worship of the great goddess Artemis. One could read in the inscriptions how that the goddess had a month of her own, and how that this month bore her name, not only in Ephesus, but elsewhere far and wide. Very full information was given with regard to the images in the temple, and mention was even made in the inscriptions of the plate-powder which was used in cleansing the images. There was very detailed information with regard to the hierarchy of the Temple of Artemis, with its orders of priests and priestesses, its robe-bearers, choristers, theologians, guards, and temple wardens, and other interesting terms used in connection with the temple.

Professor C. T. Newton, keeper of Greek and Roman antiquities at the British Museum, moved the following resolution:—"That the sculptures already found on the site of the Temple at Ephesus, and only forming a small portion of the entire remains, are incontestably of the highest artistic value, while the inscriptions, now being prepared for publication, prove also to be of great value in both a literary and archaeological point of view." The collection of inscriptions from Ephesus, he said, was not exhausted by the class which the chairman had so ably dealt with. It comprehended a vast number of documents of the highest historical importance, and especially documents which threw light on what Niebuhr declared to be the most obscure period in Greek history. After expressing his very high sense of the value of Mr. Wood's discoveries, Professor Newton went on to draw attention to one single inscription, which was, he said, unique of its kind. It related to what he might call one of the burning questions of the day. There was a war which was described in this inscription as the Common War. They did not exactly know what war was alluded to, but thought it was the invasion of the Gauls, who very much harassed Asia Minor about 270 B.C. But the results of that war, as affecting landowners and credit generally, were unmistakably stated in the inscription; and the evidence showed that real property then was regarded with the same desire for its permanent security, was fenced round with the same security, but at the same time was liable to the same disturbances as it was now. There were some very interesting inscriptions relating to Greek real property, which were only

just beginning to be understood. In connection with the commercial and social troubles following upon the Common War, it appeared from the inscriptions that the method adopted for remedying the evils was to call in dikasts from another state who might deal with the suits that had arisen without suspicion of partiality. In adopting this system of arbitrators, therefore, and in providing further, as they did, that the experts should be chosen by ballot, the Ephesians seemed to have been actuated by the fairest motives. The more they looked into the Greek inscriptions the more they found that astonishing love of order, that love of the abstract notion which they called law, pervaded the whole time down to the Roman conquest.

Mr. Beresford-Hope, M.P., seconded the resolution.

Mr. Wood gave a brief account of his work, and observed that what he had found at Ephesus recently encouraged him to persevere even to the end. Touching on the sculpture and the architecture of the temple, he said there had been many readings of the words of Pliny, but in his opinion Pliny had described the temple in a very slovenly manner. He knew he ran great risk in saying so, but he could prove it by what he had found.

The resolution was carried unanimously.

The Dean of Llandaff moved:—"That, as there is good reason to believe that many other sculptures and inscriptions may be found if the work of exploration were thoroughly completed, a new subscription-list be immediately begun, and a sub-committee, consisting of the chairman of the committee, the hon. secretary, Professor Newton, Mr. Wollaston Blake, and such other members as may be nominated by the committee, be formed and authorised to take such steps as they may consider necessary for completing the work."

Sir Talbot Baker seconded the resolution, which was also adopted.

Votes of thanks to the Society of Antiquaries for the use of the hall and to the Bishop of Durham for presiding terminated the proceedings.

### PRESERVATION OF TIMBER.

A COMMITTEE of the American Society of Civil Engineers was formed some time ago to investigate the subject of preservation of timber, and the report has been prepared. All the methods are classed under three heads, viz. (1) steeping, (2) vital suction or hydraulic pressure, (3) treatment in close vessels by steaming, vacuum pressure, &c. The systems most in use are:—1. Kyanizing, or use of corrosive sublimate. 2. Burnettizing, or use of chlorine of zinc. 3. Creosoting, or use of creosoting oil. 4. Boucherie, or use of sulphate of copper. 5. Miscellaneous, or use of various substances.

Of the first, Kyanising, it is stated that an absorption of four or five pounds of corrosive sublimate per 1,000 feet, b.m., is considered sufficient, and it would now cost about 6 dols. per 1,000 feet. It is not recommended except in situations where the air can circulate freely about the wood, as in bridges and trestles, but in very damp locations (as for ties when in wet soil and pavements), its success is doubtful. Its cost when first used led to cheating, which for a time brought discredit upon it.

Burnettizing the committee does not consider the best adapted to use where the timber is exposed to the washing action of water (as this removes the preservative); but, on account of its cheapness, it is probably to be preferred at the present time to any other process for the preservation of railroad ties. The Wellhouse, Thilmany, and other modifications of the process aim at making the chloride insoluble, but are yet on trial. This process has been largely and successfully introduced in Germany. Experience shows the life of soft wood ties to be doubled and trebled by its use. Its cost in America is about 5 dols. per 1,000 feet, b.m., or 20 to 25 cents per tie, and for the latter purpose the committee particularly recommend it. The work must be well done; but some of the failures were from doing it too well—that is, from using solutions of too great strength, thus making the timber brittle. A solution of 2 per cent. by weight of chloride of zinc in water is recommended.

Creosoting, or the injection of timber with hot creosote oil in a cylinder under pressure, is considered to be the very best process which has been fully tested, where expense is not considered. It is as yet the only one known which is sure to prevent the destructive attacks of the teredo or other marine animals, and to give absolute protection against decay in very wet situations. It is a somewhat expensive process, requiring for protection against the teredo from 10 to 20 pounds per cubic foot of timber, and costing from 12 dols. to 20 dols. per 1,000 feet, b.m. For resisting decay alone a cost of 10 dols. to 14 dols. is sufficient.

The Boucherie process, in which green timber is impregnated with sulphate of copper either by vital suction, hydraulic

pressure, or a vacuum, when well done, using a solution of one pound of sulphate to 100 of water, has proved fairly successful.

Under the head of "Miscellaneous" are classed 41 experiments, with almost as many substances—sulphate and pyrolignite of iron, lime, resin, oil, tar, &c.—but with, as yet, no commercial success.

The general principles laid down are to select the process with reference to the subsequent exposure. Use open-grained, porous timber; for that reason, in general, the cheaper woods. Extract the sap and water to make room for the material to be injected—natural seasoning, except for the Boucherie process, being very desirable. Steaming takes the place of seasoning. Use enough of the antiseptic to insure a good result, and then let the timber dry before using, as its durability will thus be increased. Do not hasten the work if it is to be well done. Protect ties or timber in the track, as far as may be, from water by drainage. Contract only with reliable parties of established reputation, under a skilled inspector, who must be in constant attendance when the magnitude of the order warrants.

## Bygones.

"Antiquity after a time has the grace of novelty."—HAZLITT.

### WINCKELMANN ON "THE LAOCOON."

ONE of the books which have created revolutions in human thought is Lessing's "Laocoon." It owes its origin to an essay by Winckelmann on "The Imitation of the Greeks in Painting and Sculpture," written in 1756, and which was the raising of a standard of revolt against the Rococo and all its works and pomps. Winckelmann maintained that in proportion as modern work approached the Greek, it became nearer perfection. But in his enthusiasm he laid down a hard-and-fast rule, and overlooked the fact that it might be true enough in sculpture, but did not apply in literature. Lessing accordingly wrote "The Laocoon" to demonstrate the difference between art and poetry. He explained that while the painter or sculptor endeavoured to gratify the external senses, the poet appealed to the imagination. Now the discovery may not appear to have much value, but in the eighteenth century it became a sort of redemption for thinkers like Goethe. The large History of Ancient Art by Winckelmann has caused his first essay to be overlooked. Accordingly we give that part which excited Lessing to produce "The Laocoon." We take it from a translation which was made by Fuseli in the days before he took up painting, and when he was known in London as a literary hack:—

The last and most eminent characteristic of the Greek works is a noble simplicity and sedate grandeur in gesture and expression. As the bottom of the sea lies peaceful beneath a foaming surface, a great soul lies sedate beneath the strife of passions in Greek figures.

'Tis in the face of Laocoon this soul shines with full lustre, not confined, however, to the face, amidst the most violent suffering. Pangs piercing every muscle, every labouring nerve; pangs which we almost feel ourselves, while we consider—not the face, nor the most expressive parts—only the belly contracted by excruciating pains: these, however, I say, exert not themselves with violence, either in the face or gesture. He pierces not heaven, like the Laocoon of Virgil; his mouth is rather opened to discharge an anxious overloaded groan, as Sadolet says; the struggling body and the supporting mind exert themselves with equal strength—nay, balance all the frame. Laocoon suffers, but suffers like the Philoctetes of Sophocles: we weeping feel his pains, but wish for the hero's strength to support his misery.

The expression of so great a soul is beyond the force of mere nature. It was in his own mind the artist was to search for the strength of spirit with which he marked his marble. Greece enjoyed artists and philosophers in the same persons; and the wisdom of more than one Metrodorus directed art, and inspired its figures with more than common souls. Had Laocoon been covered with a garb becoming an ancient sacrificer, his sufferings would have lost one-half of their expression. Bernini pretended to perceive the first effects of the operating venom in the numbness of one of the thighs.

Every action or gesture in Greek figures not stamped with this character of sage dignity, but too violent, too passionate, was called "Parthyrsos." For the more tranquillity reigns in a body the fitter it is to draw the true character of the soul, which in every excessive gesture seems to rush from her proper centre, and being hurried away by extremes becomes unnatural. Wound up to the highest pitch of passion, she may force herself upon the duller eye; but the true sphere of her action is sim-

licity and calmness. In Laocoon sufferings alone had been parathyrsos; the artist therefore, in order to reconcile the significative and ennobling qualities of his soul, put him into a posture, allowing for the sufferings that were necessary, the next to a state of tranquillity—a tranquillity, however, that is characteristic: the soul will be herself—this individual—not the soul of mankind; sedate, but active; calm, but not indifferent or drowsy.

What a contrast! how diametrically opposite to this is the taste of our modern artists, especially the young ones! On nothing do they bestow their approbation, but contortions and strange postures, inspired with boldness; this they pretend is done with spirit, with *franchezza*. Contrast is the darling of their ideas; in it they fancy every perfection. They fill their performances with comet-like eccentric souls, despising everything but an Ajax or a Capaneus.

Arts have their infancy as well as men; they begin, as well as the artist, with froth and bombast; in such buskins the muse of Æschylus stalks, and part of the diction in his "Agamemnon" is more loaded with hyperboles than all Heracitus's nonsense. Perhaps the primitive Greek painters drew in the same manner that their first good tragedian thought in.

In all human actions flutter and rashness precede, sedateness and solidity follow: but time only can discover, and the judicious will admire these only; they are the characteristics of great masters; violent passions run away with their disciples.

The sages in the art know the difficulties hid under that air of easiness:—

ut sibi quivis  
Speret idem, sudet multum, frustra que laboret  
Ausus idem.—HOR.

La Fage, though an eminent designer, was not able to attain the purity of ancient taste. Everything is animated in his works; they demand, and at the same time dissipate, your attention, like a company striving to talk all at once.

This noble simplicity and sedate grandeur is also the true characteristic mark of the best and maturest Greek writings, of the epoch and school of Socrates. Possessed of these qualities Raphael became eminently great, and he owed them to the ancients. That great soul of his, lodged in a beauteous body, was requisite for the first discovery of the true character of the ancients: he first felt all their beauties, and (what he was peculiarly happy in!) at an age when vulgar, unfeeling, and half-moulded souls overlook every higher beauty.

Ye that approach his works, teach your eyes to be sensible of those beauties, refine your taste by the true antique, and then that solemn tranquillity of the chief figures in his *Attila*, deemed insipid by the vulgar, will appear to you equally significant and sublime. The Roman bishop, in order to divert the Hun from his design of assailing Rome, appears not with the air of a Rhetor, but as a venerable man, whose very presence softens uproar into peace. Like him drawn by Virgil:—

Tum pietate gravem ac meritis, si forte virum quem  
Conspexere, silent, adrectisque auribus adstant.—ÆU. I.

Full of confidence in God, he faces down the barbarian. The two Apostles descend not with the air of slaughtering angels, but (if sacred may be compared with profane) like Jove, whose very nod shakes Olympus.

Algardi, in his celebrated representation of the same story, done in bas-relief on an altar in St. Peter's Church at Rome, was either too negligent or too weak to give this active tranquillity of his great predecessor to the figures of his Apostles. There they appear like messengers of the Lord of Hosts—here like human warriors with mortal arms.

How few of those we call connoisseurs have ever been able to understand, and sincerely to admire, the grandeur of expression in the St. Michael of Guido, in the church of the Capuchins at Rome! They prefer commonly the Archangel of Concha, whose face glows with indignation and revenge, whereas Guido's Angel, after having overthrown the fiend of God and man, hovers over him unruffled and undismayed. Thus to heighten the hero of "The Campaign," victorious Marlborough, the British poet paints the avenging angel hovering over Britannia with the like serenity and awful calmness.

The royal gallery at Dresden contains now among its treasures one of Raphael's best pictures, witness Vasari, &c., a Madonna with the Infant, St. Sixtus and St. Barbara kneeling, one on each side, and two angels in the forepart. It was the chief altar-piece in the cloister of St. Sixtus at Piacenza, which was crowded by connoisseurs, who came to see this Raphael in the same manner as Thespis was in the days of old, for the sake of the beautiful *Cupid* of Praxiteles.

Behold the Madonna! Her face brightens with innocence. A form above the female size, and the calmness of her mien, make her appear as already beatified—she has that silent awfulness which the ancients spread over their deities. How grand, how noble is her contour! The child in her arms is elevated above vulgar children by a face darting the beams of divinity through every smiling feature of harmless childhood.

St. Barbara kneels with adoring stillness at her side, but being far beneath the majesty of the chief figure, the great artist compensated her humbler graces with soft, enticing charms. The saint opposite to her is venerable with age. His features seem to bear witness of his sacred youth. The veneration which St. Barbara declares for the Madonna, expressed in the most sensible and pathetic manner by her fine hands clasped on her breast, helps to support the motion of one of St. Sixtus's hands, by which he utters his ecstasy, better becoming (as the artist judiciously thought, and chose for variety's sake) manly strength than female modesty.

Time, 'tis true, has withered the primitive splendour of this picture and partly blown off its lively colours, but still the soul with which the painter inspired his godlike work breathes life through all its parts. Let those that approach this and the rest of Raphael's works, in hopes of finding there the trifling Dutch and Flemish beauties, the laboured nicety of Netscher or Douw, flesh ivoryified by Van der Werf, or even the licked manner of some of Raphael's living countrymen, let those, I say, be told that Raphael was not a great master for them.

### SOME AMERICAN MUSEUMS.

A REPORT has been prepared by Professor Ball, F.R.S., the general director of the Science and Art Museum in Dublin, on several of the museums in America which he lately visited. Speaking generally of them, the professor says that he was impressed with the system, thoroughness, and good order which appeared to pervade the arrangements in the majority of these institutions. Many of them are of late growth, but already possess an astonishing degree of vigour, while their supporters and officers look forward in a spirit of great hopefulness to what must be described as gigantic extensions of their spheres of usefulness in the future. Largely dependent for their existence on the liberality of private individuals, they take what aid they can get from the Government, and it amounts, in the majority of cases, merely to State recognition. Those of them which possess directly educational functions claim an abundant harvest of good results, and there can be no doubt that the facilities which now exist for instruction in science and art are largely availed of in the principal cities of America.

The first is the Smithsonian Institution at Washington, which was founded by an Englishman who died at Genoa in 1829 and left a sum of money for the purpose, which now produces an income of 42,180 dols. The policy of the institution is to initiate original plans for abstruse research, especially in lines not occupied by other organisations. It freely gives its publications and specimens without requiring an equivalent in return, and places its books, apparatus, and collections at the disposal of investigators and students in any part of the world.

The National Library and National Museum at Washington have been founded in connection with the Institution. The museum building was commenced in the year 1879, and by 1881 the offices and collections were moved into it. It is in the form of a square with sides of 327 feet extreme length, and a central rotunda or dome. The total superficial area included within the walls amounts to 102,200 square feet. In the basement rooms the steam-heating apparatus, an engine, coal vaults, and stores are all provided for. On the main floor there are seventeen halls, communicating with each other by lofty archways, and affording 80,300 feet of floor and space; besides which there are on the same floor and two upper storeys 135 rooms for offices, working rooms, photographer, restaurant, &c. These together represent a space of 27,400 square feet, besides which there are about 4,000 square feet in the galleries.

The centre of the building is octagonal on the ground, passing upwards into a sixteen-side polygon 67 feet in diameter, in which there are large windows, the whole being surmounted by a slate roof and lantern, crowned by a Decorated finial, which is 108 feet from the ground. The masonry is of red brick, relieved by courses, &c., of buff and blue enamelled bricks, and a base course of granite. The main entrance, window sills, &c., are of freestone. The floor beams, girders, and roofs are of iron, and the floors are fireproofed by brick arches and concrete. The floors of the exhibition halls are of marble and tile; those of the offices and smaller halls of Florida pine. The illumination is stated to be most perfect. The cases are all of one length, 8 feet 8 inches, or sub-multiples of that length, which is the architectural unit of the building. Professor Ball expresses his admiration of the standard furniture and fittings which he saw in use, and which have the advantages of simplicity and interchangeability. Already in the Science and Art Museum of Dublin he has adopted the system, and presses have been constructed to carry interchangeable unit drawers and multiples of the unit in two dimensions.

In Philadelphia there is a museum belonging to the Academy of Natural Sciences, which was opened in 1876. Like many of the public buildings in the city, it is built of brick faced

with green serpentine, and the style adopted is Gothic. The museum and its valuable collections owe their existence exclusively to the generous gifts and gratuitous labour of private individuals. The Pennsylvania Academy of Fine Arts, which was first incorporated in 1806, occupies a handsome and commodious building in Broad Street; it is thoroughly fireproof, and the style of the architecture is Byzantine or Venetian. The material used in the construction consists largely of sandstone, marble, and granite from American localities, but some of the marble is foreign. The total cost was 400,000 dols. It is claimed to be the largest and most complete structure for the purposes of an art gallery and school, &c., in America. The several departments are as follows:—The library, which contains 1,200 volumes on art subjects. The print-room, where there are many thousands of engravings, etchings, and mezzotints, including the John S. Phillips's collection of upwards of 60,000 examples. This gentleman, a retired merchant of Philadelphia, presented the collection to the Institution. The antique rooms contain reproductions of many famous statues and the Elgin marbles, &c. Here, it may be mentioned, that over the main portal, a mutilated colossal statue of Ceres, which was dug up at Megara, in Greece, has been placed. The picture galleries are six in number. They contain, among others, many valuable paintings by old masters and modern artists of repute. The principal part of them formerly belonged to the Carey and Earl collections, which are now fully incorporated with others. The Academy is, at times, the recipient of noble gifts, as in the year 1880, when it received a sum of 60,000 dols. from Mr. Joseph E. Temple. The Academy is well provided with rooms for instruction from the life, painting, modelling, &c. The instruction is gratuitous, but applicants for admission to the classes are required to furnish satisfactory evidence that they already possess a capacity for drawing. The Pennsylvania Museum and School of Art is an imitation of the South Kensington Museum. The Memorial Hall in which it is located was one of the buildings occupied by the Centennial Exhibition of 1876, but, unlike the others, it was designed as a permanent structure; the principal materials employed being Virginia and Massachusetts granite and Pennsylvania iron. The façade is in the Renaissance style with arch balustrade and open arcade. The lighting is said to be admirably suited for the purpose of exhibiting pictures and statuary. The building contains 75,000 feet of wall space and 2,000 feet of floor space.

### LEGAL.

#### Queen's Bench Division.—June 23.

Before LORD COLERIDGE and Mr. JUSTICE MATHEW.

JOSELYN v. MEESON.

LODGMET OF PLANS.

According to one of the by-laws made under the Metropolis Management and Building Acts Amendment Act it is the duty of any person giving notice to a district-surveyor of the intended erection, alteration, or addition to a public building to deposit plans and sections relating to the work. The appellant in this case had been convicted of a breach of the provisions for building an ambulance station without notice in writing, with plans and drawings. It appeared that notice was given, but without the plans and sections, and the question was whether this ambulance station was a public building within the Acts, such as to require the deposit of plans and sections along with the notice. The statutory definition of "public buildings" was "any church, hospital, or building for any other public purpose." The ambulance station was erected at Homerton by the appellant for the Metropolitan Asylums Board, under the direction of Messrs. A. & C. Harston, architects. It was not actually connected with any fever hospital, though it was near one, and it was intended for the use of all fever hospitals in the metropolis by way of stabling for horses, &c. The builder being summoned before the magistrate for a breach of the by-laws, it was contended that he was not liable, as this was not a public building. The magistrate, however, thought otherwise, and convicted the builder, but stated a case to raise the question, and it stated that the public were not admitted to it under any circumstances.

Counsel for the defendant argued that it was not a "public building" within the Act. Mr. Meeson, the district-surveyor, appeared in person, and submitted that it was a "public building."

The Court, however, were clear that it was not, and gave judgment for the appellant, with costs.

#### High Court of Justice.—June 20.

SCOTT v. PAPE.

ANCIENT LIGHTS.

Judgment was delivered on Saturday by Mr. Justice North on an important point in connection with the law as to ancient lights. The plaintiff was the owner of a building on the west

side of Denton Yard, Newcastle-on-Tyne, which he had himself erected in 1872, in the place of old buildings, the windows of which had undoubtedly been ancient lights. In rebuilding the plaintiff had advanced the east wall by two or three feet, so that it was by so much nearer to the defendant's building on the opposite side of the yard. There was no record preserved of the windows in the old wall, but an arbitrator had ascertained their position in relation to the windows in the new wall; and it was clear that, although none of them corresponded in entirety with the new windows, yet some of them did occupy parts of the spaces of those windows. The defendant had recently pulled down his building, and was re-erecting it to a greater height, thus interfering with the lights of the plaintiff, who sought an injunction to restrain the encroachment. The point of law which was argued in the case was whether the plaintiff had not, by altering the plane of his wall in 1872, abandoned his ancient lights. His lordship, after reviewing in detail the facts of the case and the authorities bearing upon the point of law, held that the defendant had not established that which alone could justify him, namely, a clear intention on the part of the plaintiff to abandon his ancient lights, so far as he had not himself closed them up. No conclusive evidence of such intention had been adduced, and the law maintained the right in respect of any substantial part which was preserved of an ancient window. There were cases which showed that the "retirement" of a wall when altering buildings did not take away the previously existing rights in respect of that wall, and the same principle must apply to the "advancement" of a wall. So far, therefore, as the plaintiff's present windows were a substantial continuation of his old lights, and admitted rays of light which would have passed through the old windows in the old wall, the plaintiff was, notwithstanding the altered plane, entitled to an injunction. The defendant was ordered to pay the costs of the action.

#### Four Courts, Dublin.

(Before Mr. Baron DOWSE.)

PILE V. ST. PATRICK'S CATHEDRAL BOARD.

SURVEYOR'S MEMORANDA NOT PRIVILEGED.

This was an action brought to recover 4,743*l.* for work and labour done by the plaintiff, as a contractor for works and repairs at St. Patrick's Cathedral, carried out in 1882 and 1883. The defences included one that the work was done and repairs executed under an agreement that the plaintiff was to be paid according to the measurements of Messrs. Patterson & Kempster, building surveyors. In March last the plaintiff obtained an order for discovery of documents; and the affidavit made by Mr. A. Smith, on behalf of the defendant, being unsatisfactory, he, on June 3 last, obtained a further order for discovery, under which order a large number of further documents had been disclosed; but the affidavit had omitted certain original notes of measurements of the works made by Messrs. Patterson & Kempster, and which had, it appeared, been kept back on the ground that they did not belong to the defendants, and that therefore they could not disclose them.

Counsel applied on behalf of the plaintiff for an order of inspection of the notes of measurements and other documents not shown to be privileged. From the affidavits filed in support of the motion it appeared that the Board of St. Patrick's Cathedral had passed a resolution refusing to allow Mr. Pile inspection of these documents; and that they were in the possession of Messrs. Patterson & Kempster, who were employed by them; and it was contended that the defendants had the power, and were bound to disclose these documents and produce them for inspection.

Counsel for the defendants contended that his clients had no control over Messrs. Patterson & Kempster—that they had completed their duty between the parties by making out bills of measurement, which were deductions from the original notes, and that they were not bound to produce these notes, and that builders were not entitled to them; and contended further that the documents for which inspection was sought were privileged on the ground that they were information collected for the purpose of litigation.

Mr. Baron Dowse said a substantial portion of the motion must be granted—that Messrs. Patterson & Kempster owed it to both parties to produce these notes of measurements; and under the circumstances which had transpired he made an order for their production by the defendants' solicitors to the plaintiff and his solicitors on a day to be named by the order, the defendants also to pay the costs of the motion. As to the other documents, for which privilege was claimed, the learned judge said that the affidavit made by Mr. Smith, though ambiguous, seemed to bring these documents within the rule of privilege, and as the plaintiff had not cross-examined Mr. Smith he would make no rule on that part of the motion.

## CHURCH BUILDING AND RESTORATION.

**Newark.**—The foundation-stone of the Brough Chapel, near Newark, was laid on the 3rd ult. The buildings, which comprise a chapel with porch, and schoolroom in the rear, are of red brick and Ancaster stone dressings. Mr. Baines, of Newark, is the builder, and the works are being carried out at a cost of 450*l.* from designs by Mr. T. Butler Wilson, architect, 12 East Parade, Leeds.

**Chilcote.**—The church of Chilcote has been reopened after renovation. The original church, which was erected in the Norman period, has for many years past shown signs of rapid decay. Under the direction of Mr. Champneys, the walls of the old church have been cased inside and out with stone obtained from a quarry situate a few hundred yards from the church, whilst the main portion of the roofing has been preserved. The execution of the work was entrusted to Messrs. Charles Clarson & Sons, of Tamworth, and the plumbing work was executed by Mr. H. Hare, of Tamworth.

## SCHOOL BUILDINGS.

**Apperley Bridge.**—The laundry buildings, &c., in connection with the Woodhouse Grove Schools, Apperley Bridge, near Leeds, which were burnt down in February last, are to be rebuilt and fitted with machinery of the most approved pattern, concrete flooring being used. Over the engine and drying-rooms further bedroom accommodation is to be provided, also day and night staircases to the rooms on first floor, the night stairs to bedrooms, and the day stairs to boys' mechanical rooms and laboratory. The works are being carried out at a cost of 800*l.* from the designs and under the superintendence of Mr. T. Butler Wilson, architect, 12 East Parade, Leeds.

**Ipswich.**—A new Board school for infants has been opened at Rose Hill. The work was carried out by Mr. R. S. Smith, builder, of Ipswich, from the designs and under the supervision of Mr. E. F. Bisshopp, architect and diocesan surveyor, 32 Museum Street, Ipswich.

## GENERAL.

An Art School has been established for Rochester.

The Pictures received for the Artists' Exhibition, to be opened next month in Aberdeen, already amount to nearly three hundred.

Mr. Ruskin has written to the curator stating that he has no intention of removing his museum from Sheffield, and intimates that Sheffield is the ultimate destination of the painting of St. Mark's, Venice, executed by the late Mr. John Bunney.

Mr. J. Oldrid Scott has inspected Twyford Church, the total cost of restoring which he estimates at 2,215*l.*

Mr. S. Dutton Walker, F.S.A. (Walker & Howitt, architects), died at his residence last week in Nottingham.

Plans have been prepared for the erection of four mammoth warehouses at Brooklyn, U.S., on the river front, just above Bay Bridge. They are to be large enough to each hold 2,000,000 dols. worth of coffee, jute, hemp, sugar or fruits.

Competitive Plans are required for public buildings proposed to be erected for Coupar Angus.

Mr. James Maclaren, president, read a paper describing the abbey of Arbroath, at the visit of the members of the Dundee Institute of Architecture to the ruins on Saturday.

The "Gazette" announces the dissolution of partnership between Messrs. J. Maxwell, W. C. Tuke, and S. Hurst, architects, of Southport.

The Committee of the Meanwood Institute, near Leeds, of whom the Rev. Annesley Powys, vicar of Holy Trinity, is the chairman, decided to increase the accommodation by the erection of a public hall, &c. Plans were invited in limited competition, and submitted to Sir Edmund Beckett, Bart., when the designs of Mr. T. Butler Wilson, architect, 12 East Parade, Leeds, were selected.

**Liverpool Architectural Society.**—At the second meeting of the Junior Debating Club, held at the rooms, No. 9 Cook Street, Mr. James B. Hinks in the chair, a paper was read by Mr. Thomas J. Dalziel (visitor) on "Early Gothic Vaulting," and a discussion followed, in which Messrs. J. S. A. Mercer, Edmund Rathbone, J. H. Dawson, the chairman, and others took part. At the next meeting, on the 29th inst., Mr. James K. Hinks will read a paper on "Terra-cotta."

The Project of an underground railroad in Philadelphia, to run along Chestnut or Market as far as Fifty-sixth Street, has met with much favour. The estimated cost is 600,000 dols. per mile, or 3,000,000 dols. for the whole road, exclusive of rolling stock.

A Theatre is proposed to be erected in Bolton, and steps are being taken for acquiring a central site.

A Business Supplement

# The Contract Reporter.

to The Architect.

LONDON, JUNE 27, 1885.

## NOTICE TO OUR READERS.

On and after July 3 THE ARCHITECT will be dated on the day of publication, which has always been Friday, although the Paper has been dated on Saturday. This alteration is made to avoid the inconvenience which arises from many of our contributors sending us Tenders and other important information on Friday morning instead of Thursday. All communications intended for insertion in the current number must reach the Office as early as possible on Thursday afternoon. Literary matter should be addressed to the Editor, advertisements to the Publisher, 175 Strand, London, W.C.

## ADVERTISEMENT SCALE.

|                           |    |    |   |
|---------------------------|----|----|---|
| For Two Lines and under   | £0 | 2  | 6 |
| For every Additional Line | 0  | 0  | 6 |
| For Quarter Page          | 2  | 10 | 0 |
| For Half Page             | 4  | 10 | 0 |
| For a Page                | 8  | 8  | 0 |

On pages preceding and following matter, special rates.

Public Companies' Advertisements, 12l. 12s. per page; 1s. per line.

Special arrangement may be made for a series of insertions on application to the Publishers, at the Office, 175 Strand, London, W.C.

## COMPETITIONS OPEN.

**BOURNEMOUTH.**—Aug. 19.—Designs are invited for the Construction of Two Marine Piers. Mr. G. R. Andrews, Town Surveyor, Bournemouth.

**BRISTOL.**—July 20.—Designs are invited for the Erection of Board Schools, Castle Green, for 1,000 children. Mr. Benjamin Wilson, Clerk to the School Board, Guildhall, Bristol.

Established 1820.]

INTERNATIONAL HEALTH

3 Silver and 4 Bronze Medals

[Telephone No. 3,525.]

EXHIBITION, 1884.

Awarded for Sanitary Appliances.

# HENRY CONOLLY.

LIMITED,  
MANUFACTURING SANITARY ENGINEERS,

Call the attention of Architects, Surveyors, and Builders to their Closets, the advantages of which will be readily seen by the accompanying Illustration.

## THE "SAFETY" VALVE WATER-CLOSET,

WITH  
Conolly's Reversible Trap (Patent No. 3,754).

This drawing illustrates an improvement in the trap of a Closet, which admits of the outlet being placed in any position to suit the soil-pipe. This object is attained by means of a collar, which is similar in shape to that of an ordinary Valve-Closet. The base of the collar being round is flanged A; this is attached to a corresponding flange B, formed on the end of Trap by means of screw bolts, and from the drawing it will be seen that the outlet can be fixed in any position. It is obvious that this system can be adopted in every case where a separate Trap is employed.

The "Safety" Valve Water-Closet, like the "Nestor" as regards the Basin, is made with a cast lead trap above the floor line. The Trap is constructed so that the water-line is within 1½ in. of the seating of the Closet; therefore it will be seen if there become any defect in the indiarubber seating, the trap still remains sealed; by this means the necessity of a ventilating pipe is also dispensed with, also the old system of having a weeping pipe from the supply to the Lead Trap fixed in the box of Closet, there being no space for the generation of gases. The overflow arm is also protected from the possibility of soil corroding the edge of pipe, as the clack is made to open against it.

CAN BE SEEN IN ACTION IN NEW SANITARY SHOW-ROOM.

53 & 55 Hampstead Road, 169 & 171 Drummond Street,  
WAREHOUSES—TOLMERS SQUARE, N.W.

ST. BLAZEY.—June 30.—For Building Schools for Girls and Infants. Mr. A. S. Clunes, Architect, Fowey.

Leeds—J. E. Ellison, Victoria Square.

### TESTIMONIAL.

January 17, 1884.

THE PATENT SILENT ADJUSTMENTS supplied by you to the Dewsbury District Infirmary, for Windows and Fanlights, give satisfaction to all concerned. No matter how much the wind shakes, the windows are held fast in any position, and cannot shake, rattle, or move any wayless; therefore suitable for sick wards. The action for opening or closing is powerful, easy, and noiseless; therefore suitable for sick wards. We consider your adjustment to be the best in the market.

KIRK & SONS, Architects, Huddersfield and Dewsbury.

## INTERNATIONAL HEALTH EXHIBITION: GOLD MEDAL AWARDED.

## REDUCTION IN PRICE.

### THE SUPERIORITY OF THE "HYGEIAN ROCK"

## BUILDING COMPOSITION

Over all other Material for rendering Walls Damp-proof and increasing their strength, is now universally acknowledged by the leading Architects, Engineers, and Contractors.

To meet the rapidly-increasing demand, the Patentee has recently made extensive additions to his Machinery and Plant, which enables him to effect

A REDUCTION OF OVER 25 PER CENT. IN THE PRICE.

**WILLIAM WHITE,**

Head Office and Works:—BELMONT ROAD, ABERGAVENNY.

## CASES FOR BINDING THE ARCHITECT,

Price Two Shillings.—Office: 175 Strand, London, W.C.

A brick on flat and one on edge wall, suitable for Cottages, or where great economy is required. A 14-inch wall built with mortar only.

A wall built two half bricks on the flat is much stronger than an 18-inch wall built in the ordinary way.

The Sanitas Co., Limited, Bethnal Green, E.

**GRUNDY'S PATENT WARM-AIR VENTILATING FIRE GRATE.**

The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.

TESTIMONIALS.

"9 Victoria Chambers, Westminster, S.W.

"June 10, 1884.

"SIR,—I have much pleasure in testifying to the efficiency of your patent Warm-Air Fire Grate. It has been very successful, and given every satisfaction where I have used it.

Yours, &c.

"To Mr. Grundy.

JAMES WEIR, F.R.I.B.A."

"Baptist Chapel, Clapham Common, London. Richard Webb, Pastor, 10 Grafton Square.

"February 15, 1884.

"DEAR MR. GRUNDY,—I have pleasure in testifying to the excellency and efficiency of your patent Fire-Grate. It is the most charming invention for heating a large room I have ever known. I shall have pleasure in showing it to anyone who wish to have their schools or rooms pleasantly and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool,

July 1884.

"DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public.

"Mr. John Grundy."

From Hon. and Rev. G. G. Talbot, M.A., Withington

Cheltenham.

"DEAR SIR,—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen.

"Mr. John Grundy."

From F. J. Yates, Esq., Architect, Birmingham.

"The best of the kind I have seen. I shall have pleasure in securing their adoption whenever opportunity offers."

Apply to JOHN GRUNDY, 30 Duncan Terrace, City

Road, London.

VENETIAN ENAMEL MOSAIC

FOR MURAL DECORATION.

Mosaic Works conducted on the same principle as in Venice and Rome by

A. CAPPELLO,

472 KING'S ROAD, CHELSEA, LONDON, S.W.

Established in 1880.

15 YEARS IN ENGLAND WITH DR. SALVIATI.

The above Factory is established in London for the purpose of making the Venetian Enamel Mosaic Work an English trade, and to reduce the cost to half the price that has been hitherto charged abroad or by the London agents.

See "Building News," Oct. 12, 1883, in reference to the Mosaic Pictures for the new Church of the Brompton Oratory, executed by this Establishment.

Gold Enamel Mosaic Work at 15s. per sq. ft.  
Venetian Enamel Mosaic Figure Work at 20s. per sq. ft., including expenses of Fixing.

MOSAIC PAVEMENTS.

TO  
ARCHITECTS, BUILDERS,  
AND  
CONTRACTORS.

STEEL CUT NAILS!!

The modern and important discovery in the process of making Steel has so reduced the price, that Steel Cut Nails of the well-known "Mitre Brand" can now be supplied at only 1s. 6d. per cwt. more than the price of the ordinary Common Iron Cut Nails.

The Steel Cut Nails are far superior in quality and more uniform in size than any wrought or hand-made Nails yet produced, and being lighter in weight than ordinary Iron Cut Nails and free from wasters, they are found cheaper in actual use than common Iron Cut Nails at 1s. 6d. per cwt. less.

These Steel Cut Nails are specially suited for Builders, Joiners, Coopers, Pacing-Case Makers, &c., and a single trial is sufficient to convince any one of their superior quality and cheapness.

PATENT WROUGHT STEEL NAILS.  
OVAL WIRE NAILS.

Ask your Factor or Ironmonger for  
"MITRE NAILS."  
WHOLESALE AND EXPORT ONLY.

FIRST-CLASS CERTIFICATE AND SILVER MEDAL  
AT CALCUTTA EXHIBITION.

# NOTICE OF REMOVAL.

## BELLMAN'S PATENT GULLY.

This Gully possesses the following advantages:—

Receives and disconnects one Rain-water Pipe and Three Waste Pipes.

Avoids all Splashing.

Forms Drain for Area or Surface.

Ventilates the Pipes and Trap.

Is easy of Access for Clearance.

The ordinary P or S trap to be used in connection with Gully being in a separate piece, can be placed at any angle to meet the drain exactly, thus insuring a perfect joint, the Gully being fixed at right angles. This is a great advantage over other arrangements made with the trap in one piece.

The Holes for Rain-water Pipes are made both Circular and Square and of various sizes.

DESCRIPTIVE CIRCULAR ON APPLICATION.

THIS GULLY IS HIGHLY RECOMMENDED by Authorities on Sanitary Matters.

PRICE AT DEPOT:—EDWARD ST., DORSET SQUARE, N.W., 8s. 6d. each.

Also SINGLE GULLIES, for Sink Wastes only, price 3/9 each.

**BELLMAN & IVEY,**  
 (OFFICE ONLY) 37 PICCADILLY, LONDON, W.

## VOLUME XXXII. OF THE ARCHITECT.

## TRADE NOTES.

Two large stained glass windows, designed and executed by Messrs. James Ballantine & Son, Edinburgh, have just been placed in the University Chapel, Vermont, U.S.A.

THE whole of the granite used in the erection of the Cobden Hotel, Birmingham (illustrated in *The Architect* of June 6), was supplied by Messrs. James Wright & Sons, of 112 John Street, Aberdeen. The grey granite was obtained from their Sylavethic Quarry at Alford, and the red granite from their Stirling Hill Quarries at Peterhead.

MESSRS. JONES & WILLIS, of London and Birmingham, supplied the richly-embroidered silk velvet altar cover, carved oak communion chairs, &c., for the chapel of the Holloway Sanatorium.

THE Lincrusta-Walton Company will issue on July 1 a new decorated pattern-book, showing upwards of one hundred different effects in colour. The price of the book will be 20s.

MEDICAL men have long been preaching, and are now beginning to practise, the employment on sanitary grounds of flooring laid without interstices to catch the dirt, and with polished, or at least smooth, cleanly, and washable surfaces. Costliness has been hitherto a drawback to the adoption of such flooring. The solid one-inch parquet floors of Bucher & Durrer (agents, Scheibler Brothers & Co., 23 New Broad Street, E.C.) supply the needed element of relative cheapness. Messrs. Bucher & Durrer, owning large Hungarian forests, are able to supply well-seasoned woods direct from their own sawmills, at prices much below those which have hitherto been current. Their floors are durable and solid, and have the advantage of being highly artistic. They will, it may be expected and desired, on hygienic as well as artistic grounds, come into extensive use for public institutions as well as private houses.

MESSRS. FOY, MORGAN & Co. have removed their offices from 108 to 88 Bishopsgate Street Within, E.C.

A HANDSOMELY carved oak pulpit, with prayer-desk and seat to correspond, has just been

supplied to St. Woollos Church, Newport, Mon. The work has been successfully carried out by Messrs. Jones & Willis, of Birmingham and London.

THE Bournemouth Commissioners have decided to erect eight of Norton's Patent Turnstiles at the east and west entrances and landing stages of their new pier, and Messrs. Le Grand & Sutcliffe, of 100 Bunhill Row, E.C., have been entrusted with the contract for them.

MR. ROGER LOWE, of Worsley Road, Farnworth, near Bolton, has recently laid his patent wood-block floors at the Anchors Inn, Bolton (Mr. J. Simpson, architect, Bolton); at the New Drill Hall, Coplaw Road, Victoria Road, Glasgow, for the 3rd L.R.V. (Mr. J. B. Wilson, architect, Glasgow); floors of lodges, Zoological Gardens, Walton, Liverpool (Messrs. W. Sugden & Son, architects, Leek, Staffs.); floor at Alms-houses, Milnthorpe (Mr. Joseph Bintley, architect, Kendal); floor at Ophthalmic Hospital, Maidstone; floors of landings and staircases, &c. (Mr. E. W. Stephens House, architect, Maidstone); floors of Adlington New Church (Messrs. T. D. Barry & Son, architects, Liverpool); floor of cottage at Mr. Latham's new house, Eddisbury, West Derby (Mr. J. F. Doyle, architect, Liverpool).

LIVERPOOL EXHIBITION: NAVIGATION, TRAVELLING, AND COMMERCE.—This exhibition, which is to be opened in Liverpool next year, promises to be most successful, as no effort is being spared by the Council to make it as widely comprehensive as possible. The objects of the exhibition are to be historical, commercial, and educational, and it is proposed to devote the surplus funds of the exhibition to the foundation in Liverpool of a school for technical, artistic, and industrial education. From an advertisement in another column, it will be seen that the executive council are offering premiums for the three best designs for a large advertising poster, illustrative of the objects of the exhibition. This will, no doubt, result in an interesting competition. It may be stated that the guarantee fund in connection with the exhibition has already reached 31,000*l*.

ESTABLISHED 1838.

FIRST PRIZE EDALS from all the leading Exhibitions at Home and Abroad.

## THE SOFTENING AND PURIFICATION OF WATER.

AWARDED GOLD AND SILVER MEDALS AT THE INTERNATIONAL HEALTH EXHIBITION.

The PORTER-CLARK PROCESS is largely employed in County Asylums, Hospitals, Schools, and private Mansions, and is adopted upon a much larger scale in many Industries. By this process the Lime and Magnesia are removed from the water, together with organic impurities and the calcareous deposits in pipes and boilers.

JOHN HENDERSON PORTER, Patentee, 1 &amp; 2 Tudor Street, London, E.C., furnishes the necessary Plant.

## CASES FOR BINDING THE ARCHITECT.

Price Two Shillings.—Office: 175 Strand, London, W.C.

## RAILWAY EXTENSION IN ESSEX.

THE large number of visitors that annually make Southend-on-Sea their summer health resort has induced the Great Eastern Railway Company to promote a line from their Colchester and Ipswich section, near Brentwood, direct to this popular watering-place. The new road—to be commenced shortly—will pass through a picturesque portion of Essex, and will at length afford railway communication to the ancient town of Rayleigh. It will, moreover, not only give an alternative route from London, but furnish great facilities of locomotion to the whole of the Eastern Counties, and directly connect the important military centres of Shoeburyness, Warley, and Colchester. A practical illustration of the enhanced value acquired by land in the vicinity of the new line was given at the sale of a building estate near Rayleigh, held at Southend a few days since by Mr. Alf. Baker, when exceptionally good prices were realised. It is expected that quite a little township will spring up on the main road between Rayleigh and Southend.

## POPULAR PHOTOGRAPHY.

DURING nearly the whole of the half-century that has elapsed since photography first became an accomplished fact—or, to be more precise, till within about the last decade—its processes have been almost universally associated with mystery, and those who practised them have been regarded as the possessors of a secret not to be lightly divulged. Most people have been content, at some time or other, to avail themselves of the art in order to obtain photographs of themselves and their surroundings—not always, we are free to confess, with the happiest results; but how those results were arrived at has remained an unsolved problem with the great majority. If they have thought about the matter at all, vague ideas of the action of light upon certain chemicals have pervaded

their minds for a time, and then their reflections on the subject have subsided.

This general absence of natural curiosity is not at all characteristic of our inquiring dispositions, and may be traced to a distinct cause—probably the disenchantment experienced by those few outsiders who have in the past essayed to penetrate the “mystery” of photography as it existed under the conditions of the now discarded “wet” or collodion processes. An amateur desirous of practising the art under those conditions was not only faced with the initial necessity of acquiring and maintaining a cumbersome “plant,” but the preparation of his photographic plates involved such precise and careful manipulation of highly-destructive chemicals, that his experiments were more often productive of disfigured hands and ruined clothes than they were of pictures worthy of the name. Small wonder, then, that the would-be amateur photographer, finding himself so heavily handicapped, should speedily have arrived at the conclusion that *le jeu ne valait pas la chandelle*.

At length, however, it was discovered that from gelatine in combination with salts of silver could be produced a dry and portable plate, which not only obviated all these disagreeable conditions, but was also sensitive to light in a much higher degree than the “wet” plate, thereby enabling the negatives to be taken with greatly increased rapidity. This discovery may be said to have effected a revolution in the art of photography, for concurrently with its perfection people with refined tastes began to recognise in it a medium of engrossing and profitable amusement. It is satisfactory to note that the leading manufacturing photographers—notably the London Stereoscopic Company—have done, and are doing, much to foster this movement by the simplification and perfection of the apparatus, as well as by other means; for the popularisation of this beautiful art is a consummation greatly to be desired, inasmuch as the scope of its application was of necessity confined, while its practice was restricted to the comparatively few professional photographers. Its adoption,

however, by amateurs (we use this term in its widest sense) has revealed the fact that there is practically no limit to its sphere of usefulness. To the student of architecture it is a most useful servant on a sketching-tour, in supplementing the work of his pencil, because for want of time many objects of study are not able to be done justice to in his note-book. To the astronomer photography is invaluable; and in this connection it may be stated that M. Janssen, of Paris, claims to have photographed the sun in less than one two-thousandth part of a second—a startling testimony to the perfection to which the manufacture of gelatino-bromide of silver plates has attained. To the naturalist and the student of the microscope the camera lends assistance which cannot well be over-estimated; and science generally—not excluding even the science of war—is largely indebted to photography for many of its successes. It will be remembered that during the last siege of Paris important letters and despatches were transferred by photography on to sheets of minute proportions, and these being attached to highly-trained carrier pigeons, were winged over the heads of the beleaguering Germans safely to their destination.

But to enumerate all the uses to which photography may be applied is here impossible; we will therefore now turn to its claims as an amusement.

Regarded then simply as a pastime, the principal charm of photography undoubtedly lies in the power with which its users are invested of reproducing by its means exact facsimiles of such objects, animate or inanimate, as may possess for them special interest. The child who “cries for the moon” is regarded by its elders as a prodigy of inconsistency; yet we suspect most of us might plead guilty to a similar spirit of covetousness where the beautiful in nature is concerned, though we may not express our desires so loudly. Photography affords us the power of indulging this feeling to a considerable extent. We can by its aid transfer, as it were, the beauties of nature to our own possession; and the opportunities for such transference are constantly recurring.

**JOHN G. ROLLINS & CO., LD.,**

AMERICAN MERCHANTS AND FACTORS,

OLD SWAN WHARF, LONDON BRIDGE, LONDON, E.C.

The enjoyment of a pleasure-tourist, for instance, cannot but be largely enhanced if he be in possession of the means of pictorially recording for future contemplation the choicest scenic recollections of his trip. How often do we experience the desire to recount the glories of a favourite scene, yet are restrained from doing so by the conviction that verbal description is hopelessly inadequate? The delights of boating excursions and lawn-tennis parties, too—indeed of almost every kindred form of amusement—may for the same reason be materially increased.

And beyond the transient pleasure to be derived during the actual picture-taking, the work of the amateur has an enduring effect in the home circle; for the exhibition of such photographs provides a constant source of enjoyment, inasmuch as pleasant conversation is almost certain to be promoted by a comparison of the reminiscences thereby evoked. This pleasure, too, is heightened by the consciousness—not by any means to be despised—that the pictures are “home-made”: they possess, for obvious reasons, such a distinct advantage over those that may be seen exposed for sale in shop-windows.

Nor is the practice of photography necessarily limited to the summer months, as is generally supposed to be the case. Recent improvements in the apparatus have minimised the difficulties hitherto presented by the uncertain light and atmospheric conditions of winter. There are, in fact, reasons why wintry scenery is especially adapted for portrayal by photography. Landscape pictures born of the camera suffer somewhat, perhaps, in comparison with hand-painted scenes in one respect—that the colours of nature cannot as yet be reproduced through the medium of the lens, though in truth to form and detail the “sun pictures” are unsurpassable. Experiments in progress may, it is hoped, at no distant date, enable the photographic artist to compete with the knight of the brush and palette, even in respect of colour; but at present such colouring, if required, has to be supplied afterwards by hand. In winter, however, when the trees are fringed with rime instead of

leaves, when the stream is ice-bound instead of blue with the reflected sky, and when hill and dale is covered with a mantle of snow, then photography can reproduce with splendid effect, and in their natural colours, those wonderful contrasts of light and shade which are to be observed during the sterner half of the year. To drop, Silas Wegg like, into poetry:—

The flick’ring fall is o’er: the clouds disperse,  
And show the sun hung o’er the welkin’s verge,  
Shooting a bright but ineffectual beam  
On all the sparkling waste. Now is the time  
To visit nature in her grand attire.

And this applies equally to the amateur photographer as to other people. A series of winter landscapes, too, possess an increased interest if exhibited in contrast with a set of photographs taken from the same scenes during summer.

Countless other ways remain in which photography supplies amusement, but considerations of space will not permit of our alluding to them in detail. Still, it will be easily conceivable, from what has already been written, that the attributes possessed by the art sufficiently warranted the now successful attempt to render it a popular pastime. As we have already said, much of this success has been due to the manufacturers of apparatus, for in perfecting these great ingenuity has been employed in order to render them suitable for use by cultured people. Compactness combined with completeness has been the desideratum, and that this has been attained may be inferred from the fact that a complete set of instruments, including every requisite for landscape photography, can now be easily carried in one hand. The “development” of the plates, the only feature of the process at all approaching tedium, is also professionally undertaken for amateurs; and as this development can now be postponed, after exposure, almost indefinitely, without imperiling the success of the issue, this arrangement is a great boon to those who have a rooted objection to “drudgery” even in its mildest form. A noteworthy instance of the desire of manufacturing photographers to increase the popularity of the art is supplied in another direction

by the London Stereoscopic Company, who, quickly grasping the position that to promote the demand for their appliances they must themselves assist in creating a market for them, hit upon the happy—nay, liberal—expedient of giving free instruction in photography, by competent masters, to purchasers of their superior sets of apparatus. That this idea has proved successful will be apparent when we state that the company have been obliged, in consequence, to devote certain studios at their premises, 54 Cheapside, E.C., and 110 Regent Street, W., solely to the use of amateurs. We may add that the instruction is given quite privately, as opposed to class teaching—a palpable advantage when it is considered how many would be otherwise retarded in acquiring proficiency, or even restrained altogether from attempting it, by feelings of diffidence.

### THE EMPLOYERS' LIABILITY ACT.

AN important decision was given in the Queen's Bench Division on Monday in respect of one of the eleven cases of accident which occurred in connection with the fire at Messrs. Whiteley's premises in Westbourne Grove. Adjoining one side of the premises there were baths, separated by a wall 300 feet long and 60 feet high, built parallel with a wall of Whiteley's similar in size, and only one or two inches from it. On April 25, 1884, the fire took place, the premises being insured, and next day the defendants, Messrs. Greenwood, were put in possession by the insurance companies. The result of the fire was that Whiteley's wall was isolated and deprived of its internal supports, was somewhat inclining forwards, and likely to fall over the *débris*; the baths' wall by the side of it apparently standing intact, but which would be dangerous when isolated. Whiteley's wall being deemed dangerous, the surveyor of the Local Board of Works directed that both walls should be removed by Messrs. Greenwood, the contractors, and it was considered that the only safe course would be to erect a scaffolding alongside the baths' wall and take down each

## THE GREAT PROBLEM OF THE XIX<sup>TH</sup> CENTURY.

# VENTILATION WITHOUT DRAUGHT SOLVED.

The hitherto unsolved problem of “Ventilation Without Draught” is to be seen practically illustrated at FREDERICK HENRY SMITH'S Test Room, No. 68, 52 Queen Victoria Street, E.C., Patentee of the Automatic Siphonic Aspirator System of Ventilation. A personal inspection invited.

*Extract from the Annual Report of the “French Hospital and Dispensary,” issued 29th January, 1885.*

We have also to return our best thanks to Mr. Smith, who undertook gratuitously to repaint one of our wards and to apply a new system of ventilation of his own invention, which was very successful.

*Letter from David Urquhart, Assistant Engineer to Colonel Sir Francis Bolton, C.E.*

F. H. SMITH, ESQ., 52 QUEEN VICTORIA STREET, E.C.

4 THE SANCTUARY, S.W., LONDON: NOVEMBER 22nd, 1884.

In reply to your inquiry, I have much pleasure in certifying that your system of ventilation as applied to the “Island Room” of the illuminated fountains at the Health Exhibition reduced the temperature during the displays from about 110 deg. to about 70 deg., and thus enabled the men to perform their duties without inconvenience.—Yours faithfully,

DAVID URQUHART.

*Extract from the TIMES of March 14, 1885, page 7.*

“VENTILATION WITHOUT DRAUGHT.—This desideratum appears to be accomplished by a siphonic system devised by Mr. Frederick H. Smith, at whose offices, 52 Queen Victoria Street, London, we recently inspected the arrangement. The air supply is conducted into the apartment from the external atmosphere by means of air ducts, which terminate in distributing passages at the floor level. The exit for the vitiated air is placed in the ceiling, and consists of two tubes, a large and a small one, running parallel to each other between the floor joists in the case of rooms having others over them. In the case of rooms on top floors, or those having the roof directly over the ceiling, the tubes are placed concentrically, but the action and results are the same. The larger of the two tubes carries off the vitiated air, while the smaller one forms an induction tube for cold air, its outer extremity being open to the atmosphere. These two tubes or conduits are so connected that the passage of the heated air through the larger tube induces a current of cold air through the smaller one in a continuous stream. The result is a rapid clearing away of all deleterious gases and products of combustion as they accumulate, and the preservation of a pure atmosphere at an equable temperature in the apartment. In a small room at Mr. Smith's offices in which five large gas-jets were burning, the atmosphere was apparently quite innocuous at the level of about 7 feet, the temperature being about 60 deg. Fahr. At a higher level, however, and especially near to the ceiling, the temperature was high and the air greatly vitiated. It was demonstrated that this vitiated air was being drawn off through the exit tube, which acted as a powerful sucker. After turning off the gas-burners, and upon the temperature of the room generally becoming lowered and equalised, a feeble upward action was still maintained in the upcast tube, but there was no down-draught whatever. The system has already been applied to a church and other buildings with acknowledged success.”

wall inch by inch from the top. A gang of men were therefore engaged by Messrs. Greenwood for the purpose. In the meantime, however, on May 1 (in consequence, it was said, of a wind), the upper part of Whiteley's wall fell forwards upon the *débris*, while the lower part, some 10 feet or 12 feet in height, fell backwards upon and against the baths' wall and threw it down, and it fell upon the men who were at work, causing severe injuries to eleven of them. Eight or nine of them had brought actions against Messrs. Greenwood, the contractors, under the Employers' Liability Act, two or three of them being too late with their notices. These actions under the Act were brought in the County Court, and this was the first trial, and had already been twice tried, the others being removed into the High Court for trial and standing for trial next week. At the first trial of the present case, the negligence imputed to the defendants, Messrs. Greenwood, being that they had not shored up the walls, the jury found for the plaintiff for 20*l*. The County Court Judge had set aside the verdict, however, as against the weight of evidence; but on the second trial there was a claim at common law as well as under the Act, and the jury gave a verdict for the plaintiff for increased damages—50*l*. Then there was an application to set aside that verdict on the ground that there was no evidence of liability, and this now came on to be argued.

Counsel for the defendants, having obtained a rule *nisi* for a new trial on the ground that there was no evidence of negligence on the part of the contractors, appeared in support of it, and argued that there was no evidence for the jury of negligence on their part or on the part of their manager.

Lord Coleridge said that there was no evidence of negligence to sustain the verdict. It appeared that the real cause of the danger was in Whiteley's wall; the other was not injured. The plaintiff was accustomed to dangerous work of this kind; in pulling down buildings there was always more or less danger. The walls were not placed in charge of the defendants until the evening of April 30; the fall of the

walls took place early in the morning of the next day, May 1. Until that morning nothing could have been done. The danger was in the state of Whiteley's wall and its liability to fall. The course adopted was to take down both walls brick by brick from the top, and that appeared to be a proper course to be taken, though while it was being taken the walls fell. What was there which might have been and ought to have been taken before they fell? The case was put on the trial as the want of shoring. But in the process of shoring the men must have been brought close to the walls, and working at the walls, and so it would have been just as dangerous as putting up scaffolding; perhaps more so. It was impossible, therefore, to support the case for the plaintiff on that ground, and there was no evidence of negligence in that way to sustain the verdict, and, that being so, the judgment ought to be entered for the defendants.

Mr. Justice Mathew concurred, and judgment was given for the defendants.

### CONTRACTS BY ACQUIESCENCE.

A CURIOUS case has been tried lately in the Sheriff Court, Falkirk, in which an endeavour was made to base a contract on an application for information. The plaintiff, Mr. Baird, is the proprietor of patent girders, which were specified to be used in a new central school at Stenhouse Muir, for which the defendants, Messrs. J. & A. Main, had obtained the contract. The plaintiff wrote to the contractors offering to supply the girders. No reply having been received to this letter, he applied to Mr. Black, the architect for the building, drawing his attention to the fact that the girders had not been ordered from him, and explained that as they were patented they could not be ordered from any one else. Mr. Black replied that it was not for him to order the girders, and referred Mr. Baird to the contractors. The plaintiff subsequently saw the defendants at Falkirk, and sent an offer to supply the goods at certain prices. The defendants did not reply to this,

but six weeks afterwards, by instruction of the architect, they wrote asking that a section of the beams should be sent, and they added that they would require them in about six weeks. Mr. Baird forwarded to the defenders a section of the beams as desired, and stated that he would now go on with the work, so as to have them ready within six weeks. To that letter he had received no reply, but one of the defendants had called in his absence at his office in Glasgow about ten days afterwards, and had left a message to the effect that the beams were not sufficiently strong. It was contended, on behalf of the plaintiff, that a contract had been constituted by the defendants' silence and acquiescence. On the other side it was maintained that no contract had been made, and that the letter, which the plaintiff alleged was an order, had been merely a letter of inquiry. The architect had not been satisfied with the strength of the girders, and had substituted others for them. The Sheriff Substitute has issued an interlocutor, in which he finds that no contract was concluded between the parties for the supply of the girders, and has given judgment, with costs, for the defendants.

### THE NATIONAL PORTRAIT GALLERY, EDINBURGH.

THE erection of the Scottish National Portrait Gallery and Antiquarian Gallery is about to be commenced. A meeting of the Board of Trustees for Manufactures was held on the 19th inst. when the tenders of the following contractors were accepted:—masonry, Messrs. Kirkwood; carpentry, Mr. R. Shillinglaw; ironwork, Messrs. Peter Bell & Son; slating, Mr. Robert Graham; plumbing, Mr. John White; plastering, Mr. W. Baird; glazing, Mr. Robert Ross. The total amount does not reach 20,000*l*. The plans have been prepared by Dr. Rowand Anderson. As the site in Queen Street is likely to offer no difficulty in getting out foundations, it is anticipated that the works will be completed in about eighteen months.

## GEORGE WOOLLISCROFT & SON,

Chesterton Tileries—North Staffordshire; Canal Tileries—Etruria, Stoke-on-Trent; Patent Tile Works—Hanley, Stoke-on-Trent.

MANUFACTURERS OF ALL KINDS OF

Blue Bricks, suitable for Railway and other purposes. Roof, Ridge, Garden, Encaustic, Glazed, Printed, Painted, Hearth, and other Tiles. Hydraulic Pressed Roof and Floor Tiles, suitable for Churches, Public and other Buildings, as they are lighter, harder, and will not absorb 25 per cent. of water, compared with the ordinary-made Plastic Tiles. Also Paving Bricks made from the above process, and from Rock Marl.

Depot—25A Cookridge Street, LEEDS. LONDON AGENCY—52 Finsbury Pavement, E.C.

INTERNATIONAL INVENTIONS EXHIBITION, SOUTH GALLERY, NORTH COURT, STAND 222.

## HUMPHERSON'S PATENT SYPHON CISTERN & WATER-WASTE PREVENTER

Possesses the following advantages:—Great flushing power combined with simplicity of construction. A full 1½-inch water-way in every part. No valves, except ball valve, to get out of order. No tight-fitting parts, leathers, or rubber. A full flush insured whether lever is held or not. Specially adapted where low head of water can be obtained, flushing well at height of only 2 feet. No waste incurred by holding down the lever. Adapted for all kinds of flush-out or flush-down closets. Full flushing power *maintained to the last*.  
Prices—2 gallons, painted cast iron, 20s. Galvanised ditto, with strong copper cylinder, 30s. 3 gallons, painted, 25s. 3 gallons, galvanised, with strong copper cylinder, 35s.

### HUMPHERSON'S IMPROVED PIPE JOINT

For connecting earthenware traps to lead soil-pipes, or of lead or iron pipes. This simple contrivance has been introduced to meet a long recognised want in the jointing of earthenware traps to metal soil-pipes, or of lead and iron pipes which have hitherto caused so much trouble and expense by the failure of the lead or putty joint. It is very easy of application, and made in various sizes to suit all traps now in use. Price 5s. each.

### HUMPHERSON'S IMPROVED FLUSH-DOWN BASIN AND TRAP, "THE BEAUFORT,"

Specially constructed so that the flush is concentrated at the spot where the basin is usually corroded. Has great flushing power, trap being thoroughly cleansed at each discharge. Specially suitable for above Syphon Cistern.

Cane-and-White Basin and Trap, 7s. 6d.

All White Earthenware Basin and Trap, 13s.

Particulars and Prices of the above and other Appliances, post free, on application.
